Rev. 4.1, 07/2007

MPC8540 Integrated Processor Hardware Specifications

The MPC8540 integrates a PowerPC™ processor core built on Power Architecture™ technology with system logic required for networking, telecommunications, and wireless infrastructure applications. The MPC8540 is a member of the PowerQUICC™ III family of devices that combine system-level support for industry-standard interfaces with processors that implement the embedded category of the Power Architecture technology. For functional characteristics of the processor, refer to the *MPC8540 PowerQUICC III Integrated Host Processor Reference Manual*.

1 Overview

The following section provides a high-level overview of the MPC8540 features. Figure 1 shows the major functional units within the MPC8540.

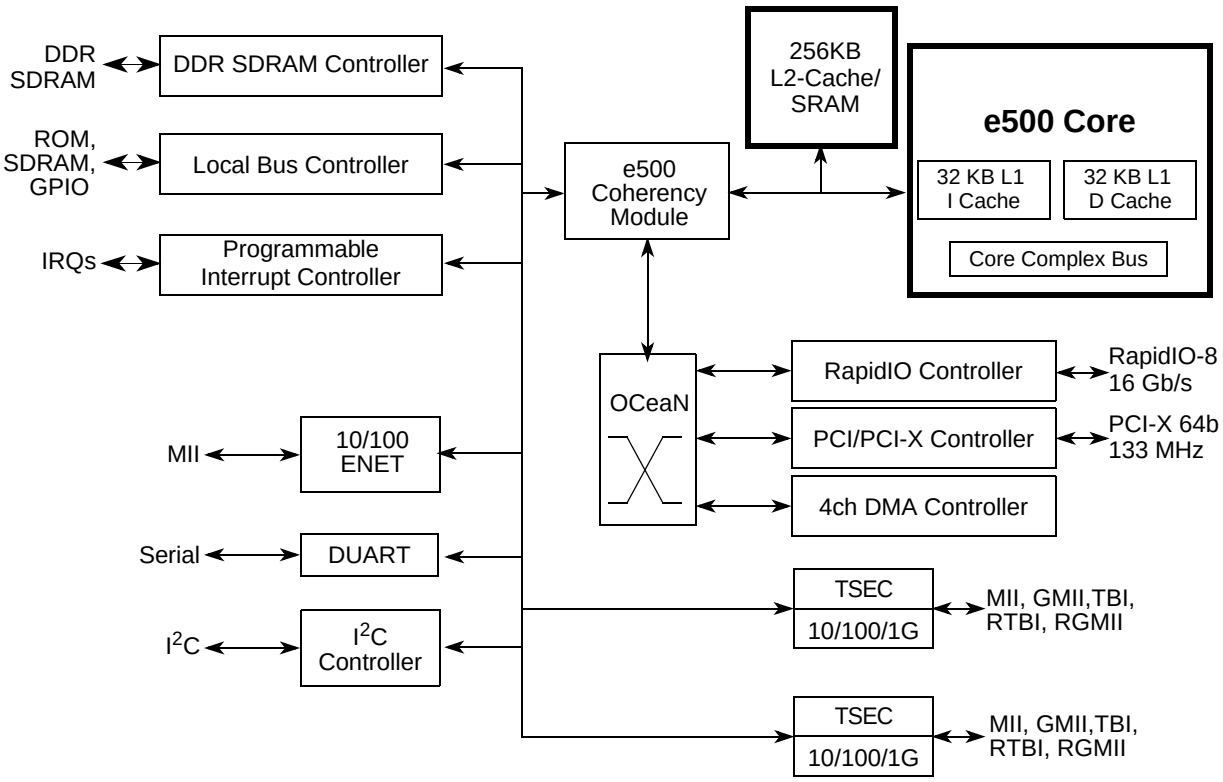

Figure 1. MPC8540 Block Diagram

1.1 Key Features

The following lists an overview of the MPC8540 feature set.

- High-performance, 32-bit Book E–enhanced core that implements the Power Architecture
  - 32-Kbyte L1 instruction cache and 32-Kbyte L1 data cache with parity protection. Caches can be locked entirely or on a per-line basis. Separate locking for instructions and data
  - Memory management unit (MMU) especially designed for embedded applications
  - Enhanced hardware and software debug support
  - Performance monitor facility (similar to but different from the MPC8540 performance monitor described in Chapter 18, “Performance Monitor.”

- 256 Kbyte L2 cache/SRAM
  - Can be configured as follows
    - Full cache mode (256-Kbyte cache).
    - Full memory-mapped SRAM mode (256-Kbyte SRAM mapped as a single 256-Kbyte block or two 128-Kbyte blocks)
    - Half SRAM and half cache mode (128-Kbyte cache and 128-Kbyte memory-mapped SRAM)
  - Full ECC support on 64-bit boundary in both cache and SRAM modes
  - Cache mode supports instruction caching, data caching, or both
  - External masters can force data to be allocated into the cache through programmed memory ranges or special transaction types (stashing)
  - Eight-way set-associative cache organization (1024 sets of 32-byte cache lines)
  - Supports locking the entire cache or selected lines. Individual line locks are set and cleared through Book E instructions or by externally mastered transactions
  - Global locking and flash clearing done through writes to L2 configuration registers
  - Instruction and data locks can be flash cleared separately
  - Read and write buffering for internal bus accesses
  - SRAM features include the following:
    - I/O devices access SRAM regions by marking transactions as snoopable (global)
    - Regions can reside at any aligned location in the memory map
    - Byte accessible ECC is protected using read-modify-write transactions accesses for smaller than cache-line accesses.
- Address translation and mapping unit (ATMU)
  - Eight local access windows define mapping within local 32-bit address space
  - Inbound and outbound ATMUs map to larger external address spaces
    - Three inbound windows plus a configuration window on PCI/PCI-X
    - Four inbound windows plus a default and configuration window on RapidIO
    - Four outbound windows plus default translation for PCI
    - Eight outbound windows plus default translation for RapidIO
- DDR memory controller
  - Programmable timing supporting DDR-1 SDRAM
  - 64-bit data interface, up to 333-MHz data rate
  - Four banks of memory supported, each up to 1 Gbyte
  - DRAM chip configurations from 64 Mbits to 1 Gbit with x8/x16 data ports
  - Full ECC support
  - Page mode support (up to 16 simultaneous open pages)
  - Contiguous or discontiguous memory mapping

  - Read-modify-write support for RapidIO atomic increment, decrement, set, and clear transactions
  - Sleep mode support for self refresh SDRAM
  - Supports auto refreshing
  - On-the-fly power management using CKE signal
  - Registered DIMM support
  - Fast memory access via JTAG port
  - 2.5-V SSTL2 compatible I/O
- RapidIO interface unit
  - 8-bit RapidIO I/O and messaging protocols
  - Source-synchronous double data rate (DDR) interfaces
  - Supports small type systems (small domain, 8-bit device ID)
  - Supports four priority levels (ordering within a level)
  - Reordering across priority levels
  - Maximum data payload of 256 bytes per packet
  - Packet pacing support at the physical layer
  - CRC protection for packets
  - Supports atomic operations increment, decrement, set, and clear
  - LVDS signaling
- RapidIO–compliant message unit
  - One inbound data message structure (inbox)
  - One outbound data message structure (outbox)
  - Supports chaining and direct modes in the outbox
  - Support of up to 16 packets per message
  - Support of up to 256 bytes per packet and up to 4 Kbytes of data per message
  - Supports one inbound doorbell message structure
- Programmable interrupt controller (PIC)
  - Programming model is compliant with the OpenPIC architecture
  - Supports 16 programmable interrupt and processor task priority levels
  - Supports 12 discrete external interrupts
  - Supports 4 message interrupts with 32-bit messages
  - Supports connection of an external interrupt controller such as the 8259 programmable interrupt controller
  - Four global high resolution timers/counters that can generate interrupts
  - Supports 22 other internal interrupt sources
  - Supports fully nested interrupt delivery
  - Interrupts can be routed to external pin for external processing

  - Interrupts can be routed to the e500 core's standard or critical interrupt inputs
  - Interrupt summary registers allow fast identification of interrupt source
- I^2C controller
  - Two-wire interface
  - Multiple master support
  - Master or slave I^2C mode support
  - On-chip digital filtering rejects spikes on the bus
- Boot sequencer
  - Optionally loads configuration data from serial ROM at reset via the I^2C interface
  - Can be used to initialize configuration registers and/or memory
  - Supports extended I^2C addressing mode
  - Data integrity checked with preamble signature and CRC
- DUART
  - Two 4-wire interfaces (SIN, SOUT, $\overline{\text{RTS}}$, $\overline{\text{CTS}}$)
  - Programming model compatible with the original 16450 UART and the PC16550D
- 10/100 fast Ethernet controller (FEC)
  - Operates at 10 to 100 megabits per second (Mbps) as a device debug and maintenance port
- Local bus controller (LBC)
  - Multiplexed 32-bit address and data operating at up to 166 MHz
  - Eight chip selects support eight external slaves
  - Up to eight-beat burst transfers
  - The 32-, 16-, and 8-bit port sizes are controlled by an on-chip memory controller
  - Three protocol engines available on a per chip select basis:
    - General purpose chip select machine (GPCM)
    - Three user programmable machines (UPMs)
    - Dedicated single data rate SDRAM controller
  - Parity support
  - Default boot ROM chip select with configurable bus width (8-,16-, or 32-bit)
- Two three-speed (10/100/1Gb) Ethernet controllers (TSECs)
  - Dual IEEE 802.3, 802.3u, 802.3x, 802.3z, 802.3ac, 802.3ab compliant controllers
  - Support for different Ethernet physical interfaces:
    - 10/100/1Gb Mbps IEEE 802.3 GMII
    - 10/100 Mbps IEEE 802.3 MII
    - 10 Mbps IEEE 802.3 MII
    - 1000 Mbps IEEE 802.3z TBI
    - 10/100/1Gb Mbps RGMII/RTBI
  - Full- and half-duplex support

  - Buffer descriptors are backward compatible with MPC8260 and MPC860T 10/100 programming models
  - 9.6-Kbyte jumbo frame support
  - RMON statistics support
  - 2-Kbyte internal transmit and receive FIFOs
  - MII management interface for control and status
  - Programmable CRC generation and checking
  - Ability to force allocation of header information and buffer descriptors into L2 cache.
- OCeaN switch fabric
  - Four-port crossbar packet switch
  - Reorders packets from a source based on priorities
  - Reorders packets to bypass blocked packets
  - Implements starvation avoidance algorithms
  - Supports packets with payloads of up to 256 bytes
- Integrated DMA controller
  - Four-channel controller
  - All channels accessible by both the local and remote masters
  - Extended DMA functions (advanced chaining and striding capability)
  - Support for scatter and gather transfers
  - Misaligned transfer capability
  - Interrupt on completed segment, link, list, and error
  - Supports transfers to or from any local memory or I/O port
  - Selectable hardware-enforced coherency (snoop/no-snoop)
  - Ability to start and flow control each DMA channel from external 3-pin interface
  - Ability to launch DMA from single write transaction
- PCI/PCI-X controller
  - PCI 2.2 and PCI-X 1.0 compatible
  - 64- or 32-bit PCI port supports at 16 to 66 MHz
  - 64-bit PCI-X support up to 133 MHz
  - Host and agent mode support
  - 64-bit dual address cycle (DAC) support
  - PCI-X supports multiple split transactions
  - Supports PCI-to-memory and memory-to-PCI streaming
  - Memory prefetching of PCI read accesses
  - Supports posting of processor-to-PCI and PCI-to-memory writes
  - PCI 3.3-V compatible
  - Selectable hardware-enforced coherency

- Power management
  - Fully static 1.2-V CMOS design with 3.3- and 2.5-V I/O
  - Supports power saving modes: doze, nap, and sleep
  - Employs dynamic power management, which automatically minimizes power consumption of blocks when they are idle.
- System performance monitor
  - Supports eight 32-bit counters that count the occurrence of selected events
  - Ability to count up to 512 counter-specific events
  - Supports 64 reference events that can be counted on any of the 8 counters
  - Supports duration and quantity threshold counting
  - Burstiness feature that permits counting of burst events with a programmable time between bursts
  - Triggering and chaining capability
  - Ability to generate an interrupt on overflow
- System access port
  - Uses JTAG interface and a TAP controller to access entire system memory map
  - Supports 32-bit accesses to configuration registers
  - Supports cache-line burst accesses to main memory
  - Supports large block (4-Kbyte) uploads and downloads
  - Supports continuous bit streaming of entire block for fast upload and download
- IEEE 1149.1-compliant, JTAG boundary scan
- 783 FC-PBGA package

2 Electrical Characteristics

This section provides the electrical specifications and thermal characteristics for the MPC8540. The MPC8540 is currently targeted to these specifications. Some of these specifications are independent of the I/O cell, but are included for a more complete reference. These are not purely I/O buffer design specifications.

2.1 Overall DC Electrical Characteristics

This section covers the ratings, conditions, and other characteristics.

2.1.1 Absolute Maximum Ratings

Table 1 provides the absolute maximum ratings.

Table 1. Absolute Maximum Ratings [1]

Characteristic		Symbol	Max Value	Unit	Notes
Core supply voltage For devices rated at 667 and 833 MHz For devices rated at 1 GHz		V_{DD}	 –0.3 to 1.32 –0.3 to 1.43	V	
PLL supply voltage For devices rated at 667 and 833 MHz For devices rated at 1 GHz		AV_{DD}	 –0.3 to 1.32 –0.3 to 1.43	V	
DDR DRAM I/O voltage		GV_{DD}	–0.3 to 3.63	V	
Three-speed Ethernet I/O voltage		LV_{DD}	–0.3 to 3.63 –0.3 to 2.75	V	
PCI/PCI-X, local bus, RapidIO, 10/100 Ethernet, MII management, DUART, system control and power management, I^2C, and JTAG I/O voltage		OV_{DD}	–0.3 to 3.63	V	3
Input voltage	DDR DRAM signals	MV_{IN}	–0.3 to (GV_{DD} + 0.3)	V	2, 5
	DDR DRAM reference	MV_{REF}	–0.3 to (GV_{DD} + 0.3)	V	2, 5
	Three-speed Ethernet signals	LV_{IN}	–0.3 to (LV_{DD} + 0.3)	V	4, 5
	Local bus, RapidIO, 10/100 Ethernet, DUART, SYSCLK, system control and power management, I^2C, and JTAG signals	OV_{IN}	–0.3 to (OV_{DD} + 0.3)	V	5
	PCI/PCI-X	OV_{IN}	–0.3 to (OV_{DD} + 0.3)	V	6
Storage temperature range		T_{STG}	–55 to 150	•C	

Notes:

1. Functional and tested operating conditions are given in Table 2. Absolute maximum ratings are stress ratings only, and functional operation at the maximums is not guaranteed. Stresses beyond those listed may affect device reliability or cause permanent damage to the device.
2. **Caution:** MV_{IN} must not exceed GV_{DD} by more than 0.3 V. This limit may be exceeded for a maximum of 20 ms during power-on reset and power-down sequences.
3. **Caution:** OV_{IN} must not exceed OV_{DD} by more than 0.3 V. This limit may be exceeded for a maximum of 20 ms during power-on reset and power-down sequences.
4. **Caution:** LV_{IN} must not exceed LV_{DD} by more than 0.3 V. This limit may be exceeded for a maximum of 20 ms during power-on reset and power-down sequences.
5. (M,L,O)V_{IN} and MV_{REF} may overshoot/undershoot to a voltage and for a maximum duration as shown in Figure 2.
6. OV_{IN} on the PCI interface may overshoot/undershoot according to the PCI Electrical Specification for 3.3-V operation, as shown in Figure 3.

2.1.2 Power Sequencing

The MPC8540 requires its power rails to be applied in a specific sequence in order to ensure proper device operation. These requirements are as follows for power up:

1. V_{DD}, AV_{DD}
2. GV_{DD}, LV_{DD}, OV_{DD} (I/O supplies)

Items on the same line have no ordering requirement with respect to one another. Items on separate lines must be ordered sequentially such that voltage rails on a previous step must reach 90 percent of their value before the voltage rails on the current step reach 10 percent of theirs.

NOTE

If the items on line 2 must precede items on line 1, please ensure that the delay will not exceed 500 ms and the power sequence is not done greater than once per day in production environment.

NOTE

From a system standpoint, if the I/O power supplies ramp prior to the V_{DD} core supply, the I/Os on the MPC8540 may drive a logic one or zero during power-up.

2.1.3 Recommended Operating Conditions

Table 2 provides the recommended operating conditions for the MPC8540. Note that the values in Table 2 are the recommended and tested operating conditions. Proper device operation outside of these conditions is not guaranteed.

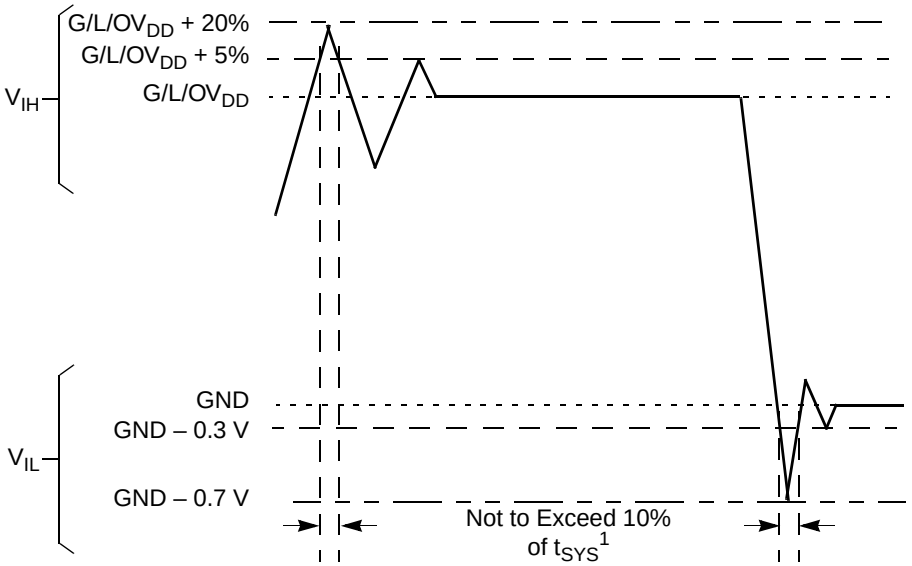
Table 2. Recommended Operating Conditions

Characteristic	Symbol	Recommended Value	Unit
Core supply voltage For devices rated at 667 and 833 MHz For devices rated at 1 GHz	V_{DD}	 1.2 V ± 60 mV 1.3 V ± 50 mV	V
PLL supply voltage For devices rated at 667 and 833 MHz For devices rated at 1 GHz	AV_{DD}	 1.2 V ± 60 mV 1.3 V ± 50 mV	V
DDR DRAM I/O voltage	GV_{DD}	2.5 V ± 125 mV	V
Three-speed Ethernet I/O voltage	LV_{DD}	3.3 V ± 165 mV 2.5 V ± 125 mV	V
PCI/PCI-X, local bus, RapidIO, 10/100 Ethernet, MII management, DUART, system control and power management, I^2C, and JTAG I/O voltage	OV_{DD}	3.3 V ± 165 mV	V

Table 2. Recommended Operating Conditions (continued)

Characteristic		Symbol	Recommended Value	Unit
Input voltage	DDR DRAM signals	MV_{IN}	GND to GV_{DD}	V
	DDR DRAM reference	MV_{REF}	GND to $GV_{DD/2}$	V
	Three-speed Ethernet signals	LV_{IN}	GND to LV_{DD}	V
	PCI/PCI-X, local bus, RapidIO, 10/100 Ethernet, MII management, DUART, SYSCLK, system control and power management, I^2C, and JTAG signals	OV_{IN}	GND to OV_{DD}	V
Die-junction temperature		T_j	0 to 105	•C

Figure 2 shows the undershoot and overshoot voltages at the interfaces of the MPC8540.



Note:
t_{SYS} refers to the clock period associated with the SYSCLK signal.

Figure 2. Overshoot/Undershoot Voltage for $GV_{DD}/OV_{DD}/LV_{DD}$

The MPC8540 core voltage must always be provided at nominal 1.2 V (see Table 2 for actual recommended core voltage). Voltage to the processor interface I/Os are provided through separate sets of supply pins and must be provided at the voltages shown in Table 2. The input voltage threshold scales with respect to the associated I/O supply voltage. OV_{DD} and LV_{DD} based receivers are simple CMOS I/O circuits and satisfy appropriate LVCMOS type specifications. The DDR SDRAM interface uses a single-ended differential receiver referenced the externally supplied MV_{REF} signal (nominally set to $GV_{DD}/2$) as is appropriate for the SSTL2 electrical signaling standard.

Figure 3 shows the undershoot and overshoot voltage of the PCI interface of the MPC8540 for the 3.3-V signals, respectively.

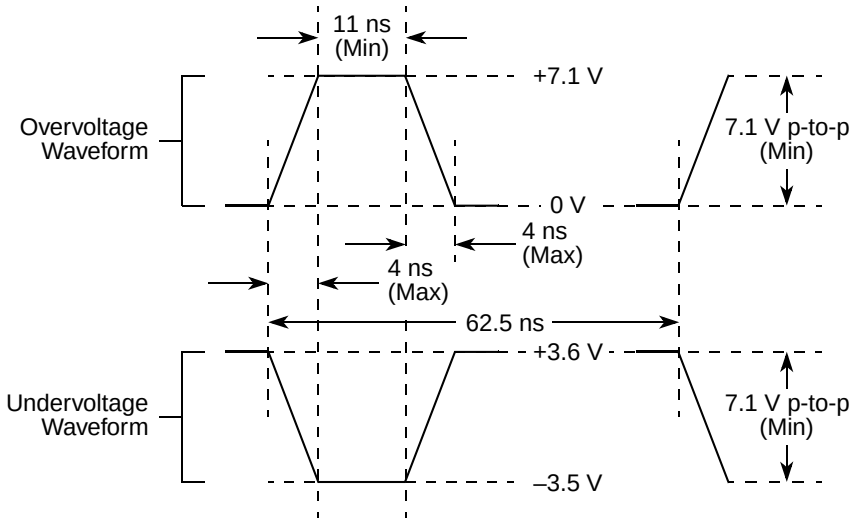


Figure 3. Maximum AC Waveforms on PCI interface for 3.3-V Signaling

2.1.4 Output Driver Characteristics

Table 3 provides information on the characteristics of the output driver strengths. The values are preliminary estimates.

Table 3. Output Drive Capability

Driver Type	Programmable Output Impedance (Ω)	Supply Voltage	Notes
Local bus interface utilities signals	25	OV_{DD} = 3.3 V	1
	42 (default)		
PCI signals	25		2
	42 (default)		
DDR signal	20	GV_{DD} = 2.5 V	
TSEC/10/100 signals	42	LV_{DD} = 2.5/3.3 V	
DUART, system control, I2C, JTAG	42	OV_{DD} = 3.3 V	
RapidIO N/A (LVDS signaling)	N/A		

Notes:

1. The drive strength of the local bus interface is determined by the configuration of the appropriate bits in PORIMPSCR.
2. The drive strength of the PCI interface is determined by the setting of the $\overline{\text{PCI\_GNT1}}$ signal at reset.

3 Power Characteristics

The estimated power dissipation on the V_{DD} supply for the MPC8540 is shown in Table 4.

Table 4. MPC8540 V_{DD} Power Dissipation [1,2]

CCB Frequency (MHz)	Core Frequency (MHz)	Typical Power[3,4]	Maximum Power[5]	Unit
200	400	4.6	7.2	W
	500	4.9	7.5	
	600	5.3	7.9	
267	533	5.5	8.2	W
	667	5.9	8.7	
	800	6.4	10.2	
333	667	6.3	9.3	W
	833	6.9	10.9	
	1000 [6]	11.3	15.9	

Notes:

1. The values do not include I/O supply power (OV_{DD}, LV_{DD}, GV_{DD}) or AV_{DD}.
2. Junction temperature is a function of die size, on-chip power dissipation, package thermal resistance, mounting site (board) temperature, air flow, power dissipation of other components on the board, and board thermal resistance. Any customer design must take these considerations into account to ensure the maximum 105 °C junction temperature is not exceeded on this device.
3. Typical Power is based on a nominal voltage of V_{DD} = 1.2 V, a nominal process, a junction temperature of T_j = 105 °C, and a Dhrystone 2.1 benchmark application.
4. Thermal solutions will likely need to design to a number higher than Typical Power based on the end application, T_A target, and I/O power.
5. Maximum power is based on a nominal voltage of V_{DD} = 1.2 V, worst case process, a junction temperature of T_j = 105 °C, and an artificial smoke test.
6. The nominal recommended V_{DD} is 1.3 V for this speed grade.

The estimated power dissipation on the AV_{DD} supplies for the MPC8540 PLLs is shown in Table 5.

Table 5. MPC8540 AV_{DD} Power Dissipation

$AV_{DD}n$	Typical[1]	Unit
$AV_{DD}1$	0.007	W
$AV_{DD}2$	0.014	W

Notes:

1. V_{DD} = 1.2 V (1.3 V for 1.0 GHz device), T_J = 105°C

Table 6 provides estimated I/O power numbers for each block: DDR, PCI, Local Bus, RapidIO, TSEC, and FEC.

Table 6. Estimated Typical I/O Power Consumption

Interface	Parameter	GV_{DD} (2.5 V)	OV_{DD} (3.3 V)	LV_{DD} (3.3 V)	LV_{DD} (2.5 V)	Units	Notes
DDR I/O	CCB = 200 MHz	0.46				W	1
	CCB = 266 MHz	0.59					
	CCB = 300 MHz	0.66					
	CCB = 333 MHz	0.73					
PCI/PCI-X I/O	32-bit, 33 MHz		0.04			W	2
	32-bit 66 MHz		0.07				
	64-bit, 66 MHz		0.14				
	64-bit, 133 MHz		0.25				
Local Bus I/O	32-bit, 33 MHz		0.07			W	3
	32-bit, 66 MHz		0.13				
	32-bit, 133 MHz		0.24				
	32-bit, 167 MHz		0.30				
RapidIO I/O	500 MHz data rate		0.96			W	4
TSEC I/O	MII			10		mW	5, 6
	GMII, TBI (2.5 V)				40		
	GMII, TBI (3.3 V)			70			
	RGMII, RTBI				40		
FEC I/O	MII		10			mW	7

Notes:

1. GV_{DD}=2.5, ECC enabled, 66% bus utilization, 33% write cycles, 10pF load on data, 10pF load on address/command, 10pF load on clock
2. OV_{DD}=3.3, 30pF load per pin, 54% bus utilization, 33% write cycles
3. OV_{DD}=3.3, 25pF load per pin, 5pF load on clock, 40% bus utilization, 33% write cycles
4. V_{DD}=1.2, OV_{DD}=3.3
5. LVDD=2.5/3.3, 15pF load per pin, 25% bus utilization
6. Power dissipation for one TSEC only
7. OV_{DD}=3.3, 20pF load per pin, 25% bus utilization

4 Clock Timing

4.1 System Clock Timing

Table 7 provides the system clock (SYSCLK) AC timing specifications for the MPC8540.

Table 7. SYSCLK AC Timing Specifications

Parameter/Condition	Symbol	Min	Typical	Max	Unit	Notes
SYSCLK frequency	f_{SYSCLK}	—	—	166	MHz	1
SYSCLK cycle time	t_{SYSCLK}	6.0	—	—	ns	
SYSCLK rise and fall time	t_{KH}, t_{KL}	0.6	1.0	1.2	ns	2
SYSCLK duty cycle	t_{KHKL}/t_{SYSCLK}	40	—	60	%	3
SYSCLK jitter	—	—	—	+/- 150	ps	4, 5

Notes:

1. **Caution:** The CCB to SYSCLK ratio and e500 core to CCB ratio settings must be chosen such that the resulting SYSCLK frequency, e500 (core) frequency, and CCB frequency do not exceed their respective maximum or minimum operating frequencies. Refer to Section 15.2, "Platform/System PLL Ratio," and Section 15.3, "e500 Core PLL Ratio," for ratio settings.
2. Rise and fall times for SYSCLK are measured at 0.6 V and 2.7 V.
3. Timing is guaranteed by design and characterization.
4. This represents the total input jitter—short term and long term—and is guaranteed by design.
5. For spread spectrum clocking, guidelines are +/-1% of the input frequency with a maximum of 60 kHz of modulation regardless of the input frequency.

4.2 TSEC Gigabit Reference Clock Timing

Table 7 provides the TSEC gigabit reference clock (EC_GTX_CLK125) AC timing specifications for the MPC8540.

Table 8. EC_GTX_CLK125 AC Timing Specifications

Parameter/Condition	Symbol	Min	Typical	Max	Unit	Notes
EC_GTX_CLK125 frequency	f_{G125}	—	125	—	MHz	
EC_GTX_CLK125 cycle time	t_{G125}	—	8	—	ns	
EC_GTX_CLK125 rise and fall time LV_{DD}=2.5 LV_{DD}=3.3	t_{G125R}, t_{G125F}	—	—	 0.75 1	ns	2
EC_GTX_CLK125 duty cycle GMII, TBI RGMII, RTBI	t_{G125H}/t_{G125}	 45 47	—	 55 53	%	1,3

Notes:

1. Timing is guaranteed by design and characterization.
2. Rise and fall times for EC_GTX_CLK125 are measured from 0.5V and 2.0V for LV_{DD}=2.5V, and from 0.6 and 2.7V for LV_{DD}=3.3V.
3. EC_GTX_CLK125 is used to generate GTX clock for TSEC transmitter with 2% degradation EC_GTX_CLK125 duty cycle can be loosened from 47/53% as long as PHY device can tolerate the duty cycle generated by GTX_CLK of TSEC.

4.3 RapidIO Transmit Clock Input Timing

Table 9 provides the RapidIO transmit clock input (RIO_TX_CLK_IN) AC timing specifications for the MPC8540.

Table 9. RIO_TX_CLK_IN AC Timing Specifications

Parameter/Condition	Symbol	Min	Typical	Max	Unit	Notes
RIO_TX_CLK_IN frequency	f_{RCLK}	125	—	—	MHz	
RIO_TX_CLK_IN cycle time	t_{RCLK}	—	—	8	ns	
RIO_TX_CLK_IN duty cycle	t_{RCLKH}/t_{RCLK}	48	—	52	%	1

Notes:

1. Requires ±100 ppm long term frequency stability. Timing is guaranteed by design and characterization.

4.4 Real Time Clock Timing

Table 10 provides the real time clock (RTC) AC timing specifications for the MPC8540.

Table 10. RTC AC Timing Specifications

Parameter/Condition	Symbol	Min	Typical	Max	Unit	Notes
RTC clock high time	t_{RTCH}	2 x t_{CCB_CLK}	—	—	ns	
RTC clock low time	t_{RTCL}	2 x t_{CCB_CLK}	—	—	ns	

5 RESET Initialization

This section describes the AC electrical specifications for the RESET initialization timing requirements of the MPC8540. Table 7 provides the RESET initialization AC timing specifications for the MPC8540.

Table 11. RESET Initialization Timing Specifications

Parameter/Condition	Min	Max	Unit	Notes
Required assertion time of $\overline{\text{HRESET}}$	100	—	μs	
Minimum assertion time for $\overline{\text{SRESET}}$	512	—	SYSCLKs	1
PLL input setup time with stable SYSCLK before $\overline{\text{HRESET}}$ negation	100	—	μs	
Input setup time for POR configs (other than PLL config) with respect to negation of $\overline{\text{HRESET}}$	4	—	SYSCLKs	1
Input hold time for POR configs (including PLL config) with respect to negation of $\overline{\text{HRESET}}$	2	—	SYSCLKs	1

Table 11. RESET Initialization Timing Specifications (continued)

Parameter/Condition	Min	Max	Unit	Notes
Maximum valid-to-high impedance time for actively driven POR configs with respect to negation of $\overline{\text{HRESET}}$	—	5	SYSCLKs	1

Notes:
1.SYSCLK is identical to the PCI_CLK signal and is the primary clock input for the MPC8540. See the MPC8540 Integrated Processor Preliminary Reference Manual for more details.

Table 12 provides the PLL and DLL lock times.

Table 12. PLL and DLL Lock Times

Parameter/Condition	Min	Max	Unit	Notes
PLL lock times	—	100	μs	
DLL lock times	7680	122,880	CCB Clocks	1, 2

Notes:
1.DLL lock times are a function of the ratio between the output clock and the platform (or CCB) clock. A 2:1 ratio results in the minimum and an 8:1 ratio results in the maximum.
2. The CCB clock is determined by the SYSCLK × platform PLL ratio.

6 DDR SDRAM

This section describes the DC and AC electrical specifications for the DDR SDRAM interface of the MPC8540.

6.1 DDR SDRAM DC Electrical Characteristics

Table 13 provides the recommended operating conditions for the DDR SDRAM component(s) of the MPC8540.

Table 13. DDR SDRAM DC Electrical Characteristics

Parameter/Condition	Symbol	Min	Max	Unit	Notes
I/O supply voltage	GV_{DD}	2.375	2.625	V	1
I/O reference voltage	MV_{REF}	$0.49 \times GV_{DD}$	$0.51 \times GV_{DD}$	V	2
I/O termination voltage	V_{TT}	$MV_{REF} - 0.04$	$MV_{REF} + 0.04$	V	3
Input high voltage	V_{IH}	$MV_{REF} + 0.18$	$GV_{DD} + 0.3$	V	4
Input low voltage	V_{IL}	–0.3	$MV_{REF} - 0.18$	V	4
Output leakage current	I_{OZ}	–10	10	μA	5
Output high current (V_{OUT} = 1.95 V)	I_{OH}	–15.2	—	mA	
Output low current (V_{OUT} = 0.35 V)	I_{OL}	15.2	—	mA	

Table 13. DDR SDRAM DC Electrical Characteristics (continued)

Parameter/Condition	Symbol	Min	Max	Unit	Notes
MV_{REF} input leakage current	I_{VREF}	—	100	μA	

Notes:

1. GV_{DD} is expected to be within 50 mV of the DRAM GV_{DD} at all times.
2. MV_{REF} is expected to be equal to 0.5 × GV_{DD}, and to track GV_{DD} DC variations as measured at the receiver. Peak-to-peak noise on MV_{REF} may not exceed ±2% of the DC value.
3. V_{TT} is not applied directly to the device. It is the supply to which far end signal termination is made and is expected to be equal to MV_{REF}. This rail should track variations in the DC level of MV_{REF}.
4. V_{IH} can tolerate an overshoot of 1.2V over GV_{DD} for a pulse width of ≤3 ns, and the pulse width cannot be greater than t_{MCK}. V_{IL} can tolerate an undershoot of 1.2V below GND for a pulse width of ≤3 ns, and the pulse width cannot be greater than t_{MCK}.
5. Output leakage is measured with all outputs disabled, 0 V ≤ V_{OUT} ≤ GV_{DD}.

Table 14 provides the DDR capacitance.

Table 14. DDR SDRAM Capacitance

Parameter/Condition	Symbol	Min	Max	Unit	Notes
Input/output capacitance: DQ, DQS, MSYNC_IN	C_{IO}	6	8	pF	1
Delta input/output capacitance: DQ, DQS	C_{DIO}	—	0.5	pF	1

Note:

1. This parameter is sampled. GV_{DD} = 2.5 V ± 0.125 V, f = 1 MHz, T_A = 25°C, V_{OUT} = GV_{DD}/2, V_{OUT} (peak to peak) = 0.2 V.

6.2 DDR SDRAM AC Electrical Characteristics

This section provides the AC electrical characteristics for the DDR SDRAM interface.

6.2.1 DDR SDRAM Input AC Timing Specifications

Table 15 provides the input AC timing specifications for the DDR SDRAM interface.

Table 15. DDR SDRAM Input AC Timing Specifications

At recommended operating conditions with GV_{DD} of 2.5 V ± 5%.

Parameter	Symbol	Min	Max	Unit	Notes
AC input low voltage	V_{IL}	—	MV_{REF} – 0.31	V	
AC input high voltage	V_{IH}	MV_{REF} + 0.31	GV_{DD} + 0.3	V	
MDQS—MDQ/MECC input skew per byte For DDR = 333 MHz For DDR ≤ 266 MHz	t_{DISKEW}	 -750 -1125	 750 1125	ps	1, 2

Note:

1. Maximum possible skew between a data strobe (MDQS[n]) and any corresponding bit of data (MDQ[8n + {0...7}] if 0 ≤ n ≤ 7) or ECC (MECC[{0...7}] if n=8).
2. For timing budget analysis, the MPC8540 consumes ±550 ps of the total budget.

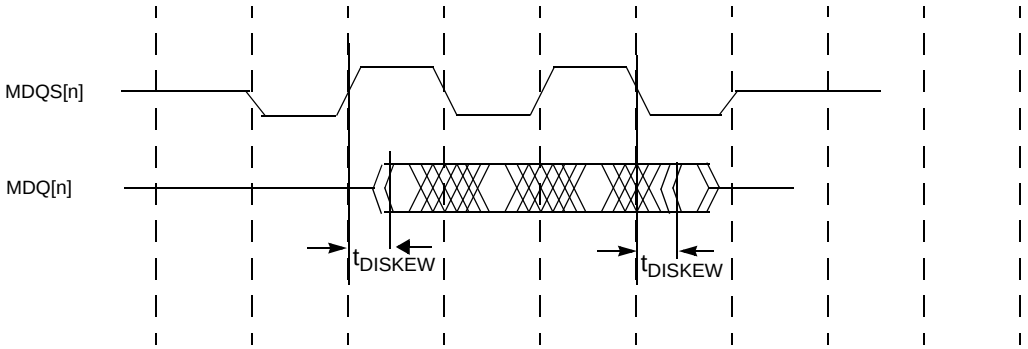

Figure 4. DDR SDRAM Interface Input Timing

6.2.2 DDR SDRAM Output AC Timing Specifications

For chip selects $\overline{\text{MCS1}}$ and $\overline{\text{MCS2}}$, there will always be at least 200 DDR memory clocks coming out of self-refresh after an $\overline{\text{HRESET}}$ before a precharge occurs. This will not necessarily be the case for chip selects $\overline{\text{MCS0}}$ and $\overline{\text{MCS3}}$.

6.2.2.1 DLL Enabled Mode

Table 16 and Table 17 provide the output AC timing specifications and measurement conditions for the DDR SDRAM interface with the DDR DLL enabled.

Table 16. DDR SDRAM Output AC Timing Specifications–DLL Mode

At recommended operating conditions with GV_{DD} of 2.5 V ± 5%.

Parameter	Symbol [1]	Min	Max	Unit	Notes
MCK[n] cycle time, (MCK[n]/$\overline{\text{MCK}}$[n] crossing)	t_{MCK}	6	10	ns	2
On chip Clock Skew	$t_{MCKSKEW}$	—	150	ps	3, 8
MCK[n] duty cycle	t_{MCKH}/t_{MCK}	45	55	%	8
ADDR/CMD output valid	t_{DDKHOV}	—	3	ns	4, 9
ADDR/CMD output invalid	t_{DDKHOX}	1	—	ns	4, 9
Write CMD to first MDQS capture edge	t_{DDSHMH}	t_{MCK} + 1.5	t_{MCK} + 4.0	ns	5
MDQ/MECC/MDM output setup with respect to MDQS 333 MHz 266 MHz 200 MHz	t_{DDKHDS}, t_{DDKLDS}	 900 1100 1200	—	ps	6, 9
MDQ/MECC/MDM output hold with respect to MDQS 333 MHz 266 MHz 200 MHz	t_{DDKHDX}, t_{DDKLDX}	 900 1100 1200	—	ps	6, 9
MDQS preamble start	t_{DDSHMP}	0.75 × t_{MCK} + 1.5	0.75 × t_{MCK} + 4.0	ns	7, 8

Table 16. DDR SDRAM Output AC Timing Specifications–DLL Mode (continued)

At recommended operating conditions with GV_{DD} of 2.5 V ± 5%.

Parameter	Symbol [1]	Min	Max	Unit	Notes
MDQS epilogue end	t_{DDSHME}	1.5	4.0	ns	7, 8

Notes:

1.The symbols used for timing specifications follow the pattern of $t_{\text{(first two letters of functional block)(signal)(state) (reference)(state)}}$ for inputs and $t_{\text{(first two letters of functional block)(reference)(state)(signal)(state)}}$ for outputs. Output hold time can be read as DDR timing (DD) from the rising or falling edge of the reference clock (KH or KL) until the output went invalid (OX or DX). For example, t_{DDKHOV} symbolizes DDR timing (DD) for the time t_{MCK} memory clock reference (K) goes from the high (H) state until outputs (O) are valid (V) or output valid time. Also, t_{DDKLDX} symbolizes DDR timing (DD) for the time t_{MCK} memory clock reference (K) goes low (L) until data outputs (D) are invalid (X) or data output hold time.

2.All MCK/$\overline{\text{MCK}}$ referenced measurements are made from the crossing of the two signals ±0.1 V.

3.Maximum possible clock skew between a clock MCK[n] and its relative inverse clock $\overline{\text{MCK}}$[n], or between a clock MCK[n] and a relative clock MCK[m] or MSYNC_OUT. Skew measured between complementary signals at $GV_{DD}/2$.

4.ADDR/CMD includes all DDR SDRAM output signals except MCK/$\overline{\text{MCK}}$ and MDQ/MECC/MDM/MDQS.

5.Note that t_{DDSHMH} follows the symbol conventions described in note 1. For example, t_{DDSHMH} describes the DDR timing (DD) from the rising edge of the MSYNC_IN clock (SH) until the MDQS signal is valid (MH). t_{DDSHMH} can be modified through control of the DQSS override bits in the TIMING_CFG_2 register. These controls allow the relationship between the synchronous clock control timing and the source-synchronous DQS domain to be modified by the user. For best turnaround times, these may need to be set to delay t_{DDSHMH} an additional $0.25t_{MCK}$. This will also affect t_{DDSHMP} and t_{DDSHME} accordingly. See the *MPC8540 PowerQUICC III Integrated Host Processor Reference Manual* for a description and understanding of the timing modifications enabled by use of these bits.

6.Determined by maximum possible skew between a data strobe (MDQS) and any corresponding bit of data (MDQ), ECC (MECC), or data mask (MDM). The data strobe should be centered inside of the data eye at the pins of the MPC8540.

7.All outputs are referenced to the rising edge of MSYNC_IN (S) at the pins of the MPC8540. Note that t_{DDSHMP} follows the symbol conventions described in note 1. For example, t_{DDSHMP} describes the DDR timing (DD) from the rising edge of the MSYNC_IN clock (SH) for the duration of the MDQS signal precharge period (MP).

8.Guaranteed by design.

9.Guaranteed by characterization.

Figure 5 provides the AC test load for the DDR bus.

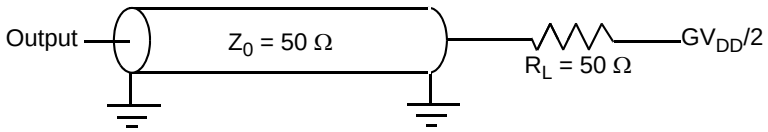

Figure 5. DDR AC Test Load

Table 17. DDR SDRAM Measurement Conditions

Symbol	DDR	Unit	Notes
V_{TH}	MV_{REF} ± 0.31 V	V	1
V_{OUT}	0.5 × GV_{DD}	V	2

Notes:

1.Data input threshold measurement point.

2.Data output measurement point.

Figure 6 shows the DDR SDRAM output timing diagram.

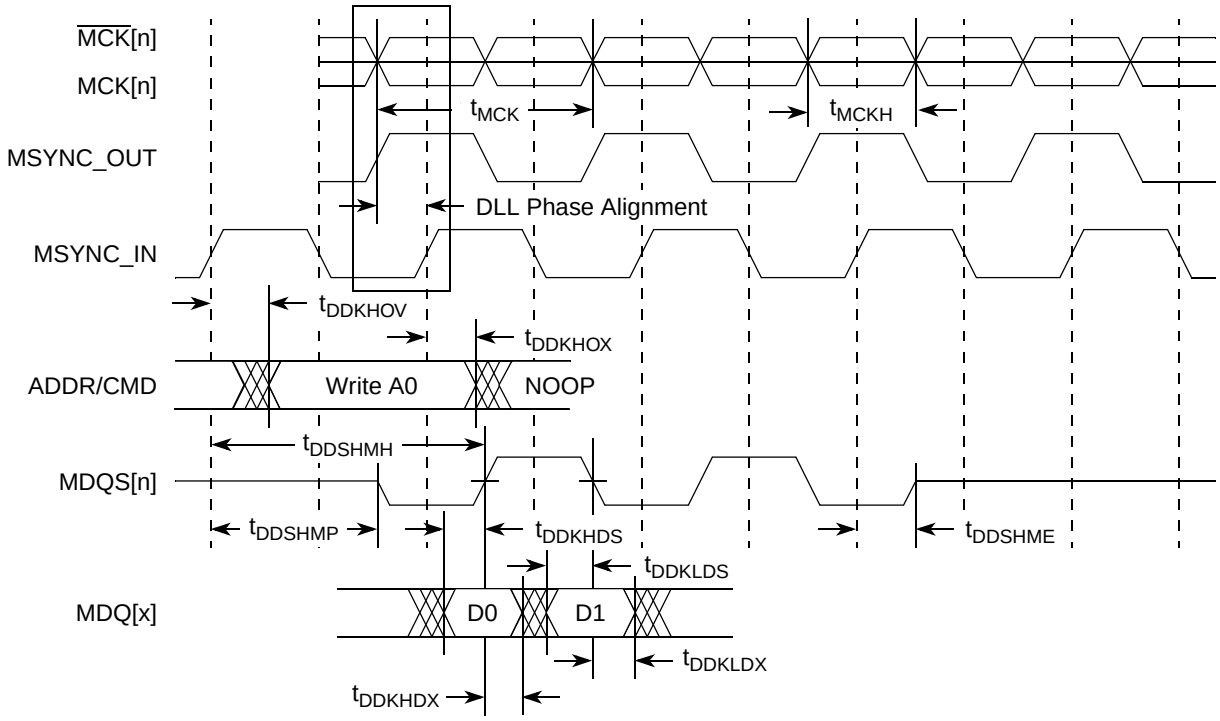

Figure 6. DDR SDRAM Output Timing Diagram

6.2.2.2 Load Effects on Address/Command Bus

Table 18 provides approximate delay information that can be expected for the address and command signals of the DDR controller for various loadings. These numbers are the result of simulations for one topology. The delay numbers will strongly depend on the topology used. These delay numbers show the total delay for the address and command to arrive at the DRAM devices. The actual delay could be different than the delays seen in simulation, depending on the system topology. If a heavily loaded system is used, the DLL loop may need to be adjusted to meet setup requirements at the DRAM.

Table 18. Expected Delays for Address/Command

Load	Delay	Unit
4 devices (12 pF)	3.0	ns
9 devices (27 pF)	3.6	ns
36 devices (108 pF) + 40 pF compensation capacitor	5.0	ns
36 devices (108 pF) + 80 pF compensation capacitor	5.2	ns

7 DUART

This section describes the DC and AC electrical specifications for the DUART interface of the MPC8540.

7.1 DUART DC Electrical Characteristics

Table 19 provides the DC electrical characteristics for the DUART interface of the MPC8540.

Table 19. DUART DC Electrical Characteristics

Parameter	Symbol	Min	Max	Unit
High-level input voltage	V_{IH}	2	OV_{DD} + 0.3	V
Low-level input voltage	V_{IL}	–0.3	0.8	V
Input current (V_{IN} [1] = 0 V or V_{IN} = V_{DD})	I_{IN}	—	±5	μA
High-level output voltage (OV_{DD} = min, I_{OH} = –100 μA)	V_{OH}	OV_{DD} – 0.2	—	V
Low-level output voltage (OV_{DD} = min, I_{OL} = 100 μA)	V_{OL}	—	0.2	V

Note:

1.Note that the symbol V_{IN}, in this case, represents the OV_{IN} symbol referenced in Table 1 and Table 2.

7.2 DUART AC Electrical Specifications

Table 20 provides the AC timing parameters for the DUART interface of the MPC8540.

Table 20. DUART AC Timing Specifications

Parameter	Value	Unit	Notes
Minimum baud rate	f_{CCB_CLK} / 1048576	baud	3
Maximum baud rate	f_{CCB_CLK} / 16	baud	1, 3
Oversample rate	16	—	2, 3

Notes:

1.Actual attainable baud rate will be limited by the latency of interrupt processing.

2.The middle of a start bit is detected as the 8^{th} sampled 0 after the 1-to-0 transition of the start bit. Subsequent bit values are sampled each 16^{th} sample.

3.Guaranteed by design.

8 Ethernet: Three-Speed,10/100, MII Management

This section provides the AC and DC electrical characteristics for three-speed, 10/100, and MII management.

8.1 Three-Speed Ethernet Controller (TSEC) (10/100/1Gb Mbps)—GMII/MII/TBI/RGMII/RTBI Electrical Characteristics

The electrical characteristics specified here apply to all GMII (gigabit media independent interface), MII (media independent interface), TBI (ten-bit interface), RGMII (reduced gigabit media independent interface), and RTBI (reduced ten-bit interface) signals except MDIO (management data input/output) and MDC (management data clock). The RGMII and RTBI interfaces are defined for 2.5 V, while the GMII, MII, and TBI interfaces can be operated at 3.3 or 2.5 V. Whether the GMII, MII, or TBI interface is operated at 3.3 or 2.5 V, the timing is compliant with the IEEE 802.3 standard. The RGMII and RTBI interfaces follow the Hewlett-Packard reduced pin-count interface for Gigabit Ethernet Physical Layer Device Specification Version 1.2a (9/22/2000). The electrical characteristics for MDIO and MDC are specified in Section 8.4, "Ethernet Management Interface Electrical Characteristics."

8.1.1 TSEC DC Electrical Characteristics

All GMII, MII, TBI, RGMII, and RTBI drivers and receivers comply with the DC parametric attributes specified in Table 21 and Table 22. The potential applied to the input of a GMII, MII, TBI, RGMII, or RTBI receiver may exceed the potential of the receiver's power supply (i.e., a GMII driver powered from a 3.6 V supply driving V_{OH} into a GMII receiver powered from a 2.5 V supply). Tolerance for dissimilar GMII driver and receiver supply potentials is implicit in these specifications. The RGMII and RTBI signals are based on a 2.5 V CMOS interface voltage as defined by JEDEC EIA/JESD8-5.

Table 21. GMII, MII, and TBI DC Electrical Characteristics

Parameter	Symbol	Min	Max	Unit
Supply voltage 3.3 V	LV_{DD}	3.13	3.47	V
Output high voltage (LV_{DD} = Min, I_{OH} = –4.0 mA)	V_{OH}	2.40	LV_{DD} + 0.3	V
Output low voltage (LV_{DD} = Min, I_{OL} = 4.0 mA)	V_{OL}	GND	0.50	V
Input high voltage	V_{IH}	1.70	LV_{DD} + 0.3	V
Input low voltage	V_{IL}	–0.3	0.90	V
Input high current (V_{IN} [1] = LV_{DD})	I_{IH}	—	40	μA
Input low current (V_{IN} [1] = GND)	I_{IL}	–600	—	μA

Note:

1.The symbol V_{IN}, in this case, represents the LV_{IN} symbol referenced in Table 1 and Table 2.

Table 22. GMII, MII, RGMII, RTBI, and TBI DC Electrical Characteristics

Parameters	Symbol	Min	Max	Unit
Supply voltage 2.5 V	LV_{DD}	2.37	2.63	V
Output high voltage (LV_{DD} = Min, I_{OH} = –1.0 mA)	V_{OH}	2.00	LV_{DD} + 0.3	V
Output low voltage (LV_{DD} = Min, I_{OL} = 1.0 mA)	V_{OL}	GND – 0.3	0.40	V
Input high voltage	V_{IH}	1.70	LV_{DD} + 0.3	V
Input low voltage	V_{IL}	–0.3	0.70	V
Input high current (V_{IN} [1] = LV_{DD})	I_{IH}	—	10	μA
Input low current (V_{IN} [1] = GND)	I_{IL}	–15	—	μA

Note:

1.Note that the symbol V_{IN}, in this case, represents the LV_{IN} symbol referenced in Table 1and Table 2.

8.2 GMII, MII, TBI, RGMII, and RTBI AC Timing Specifications

The AC timing specifications for GMII, MII, TBI, RGMII, and RTBI are presented in this section.

8.2.1 GMII AC Timing Specifications

This section describes the GMII transmit and receive AC timing specifications.

8.2.1.1 GMII Transmit AC Timing Specifications

Table 23 provides the GMII transmit AC timing specifications.

Table 23. GMII Transmit AC Timing Specifications

At recommended operating conditions with LV_{DD} of 3.3 V ± 5%, or LV_{DD}=2.5V ± 5%.

Parameter/Condition	Symbol [1]	Min	Typ	Max	Unit
GTX_CLK clock period	t_{GTX}	—	8.0	—	ns
GTX_CLK duty cycle	t_{GTXH}/t_{GTX}	40	—	60	%
GMII data TXD[7:0], TX_ER, TX_EN setup time	t_{GTKHDV}	2.5	—	—	ns
GTX_CLK to GMII data TXD[7:0], TX_ER, TX_EN delay	t_{GTKHDX} [3]	0.5	—	5.0	ns

Table 23. GMII Transmit AC Timing Specifications (continued)

At recommended operating conditions with LV_{DD} of 3.3 V ± 5%, or LV_{DD}=2.5V ± 5%.

Parameter/Condition	Symbol [1]	Min	Typ	Max	Unit
GTX_CLK data clock rise and fall time	t_{GTXR}, t_{GTXF} [2,4]	—	—	1.0	ns

Notes:

1. The symbols used for timing specifications herein follow the pattern $t_{\text{(first two letters of functional block)(signal)(state)(reference)(state)}}$ for inputs and $t_{\text{(first two letters of functional block)(reference)(state)(signal)(state)}}$ for outputs. For example, t_{GTKHDV} symbolizes GMII transmit timing (GT) with respect to the t_{GTX} clock reference (K) going to the high state (H) relative to the time date input signals (D) reaching the valid state (V) to state or setup time. Also, t_{GTKHDX} symbolizes GMII transmit timing (GT) with respect to the t_{GTX} clock reference (K) going to the high state (H) relative to the time date input signals (D) going invalid (X) or hold time. Note that, in general, the clock reference symbol representation is based on three letters representing the clock of a particular functional. For example, the subscript of t_{GTX} represents the GMII(G) transmit (TX) clock. For rise and fall times, the latter convention is used with the appropriate letter: R (rise) or F (fall).
2. Signal timings are measured at 0.7 V and 1.9 V voltage levels.
3. Guaranteed by characterization.
4. Guaranteed by design.

Figure 7 shows the GMII transmit AC timing diagram.

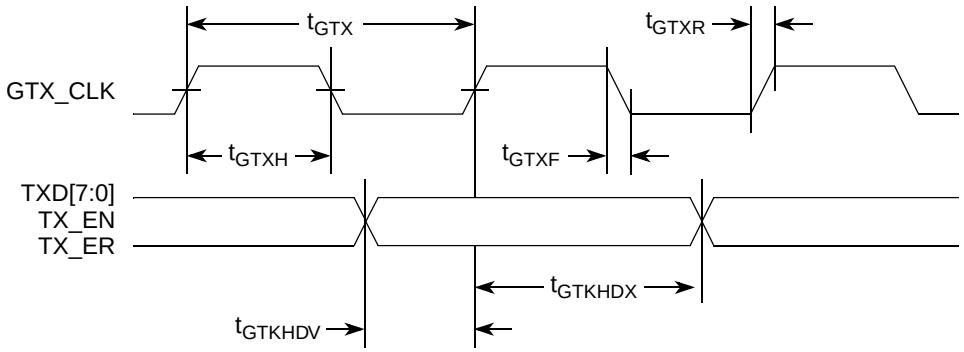

Figure 7. GMII Transmit AC Timing Diagram

8.2.1.2 GMII Receive AC Timing Specifications

Table 24 provides the GMII receive AC timing specifications.

Table 24. GMII Receive AC Timing Specifications

At recommended operating conditions with LV_{DD} of 3.3 V ± 5%, or LV_{DD}=2.5V ± 5%.

Parameter/Condition	Symbol [1]	Min	Typ	Max	Unit
RX_CLK clock period	t_{GRX}	—	8.0	—	ns
RX_CLK duty cycle	t_{GRXH}/t_{GRX}	40	—	60	ns
RXD[7:0], RX_DV, RX_ER setup time to RX_CLK	t_{GRDVKH}	2.0	—	—	ns
RXD[7:0], RX_DV, RX_ER hold time to RX_CLK	t_{GRDXKH}	0.5	—	—	ns

Table 24. GMII Receive AC Timing Specifications (continued)

At recommended operating conditions with LV_{DD} of 3.3 V ± 5%, or LV_{DD}=2.5V ± 5%.

Parameter/Condition	Symbol [1]	Min	Typ	Max	Unit
RX_CLK clock rise and fall time	t_{GRXR}, t_{GRXF} [2,3]	—	—	1.0	ns

Note:

1. The symbols used for timing specifications herein follow the pattern of $t_{\text{(first two letters of functional block)(signal)(state)(reference)(state)}}$ for inputs and $t_{\text{(first two letters of functional block)(reference)(state)(signal)(state)}}$ for outputs. For example, t_{GRDVKH} symbolizes GMII receive timing (GR) with respect to the time data input signals (D) reaching the valid state (V) relative to the t_{RX} clock reference (K) going to the high state (H) or setup time. Also, t_{GRDXKL} symbolizes GMII receive timing (GR) with respect to the time data input signals (D) went invalid (X) relative to the t_{GRX} clock reference (K) going to the low (L) state or hold time. Note that, in general, the clock reference symbol representation is based on three letters representing the clock of a particular functional. For example, the subscript of t_{GRX} represents the GMII (G) receive (RX) clock. For rise and fall times, the latter convention is used with the appropriate letter: R (rise) or F (fall).
2. Signal timings are measured at 0.7 V and 1.9 V voltage levels.
3. Guaranteed by design.

Figure 8 provides the AC test load for TSEC.

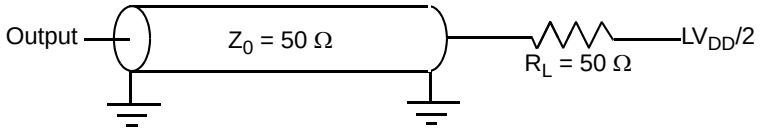

Figure 8. TSEC AC Test Load

Figure 9 shows the GMII receive AC timing diagram.

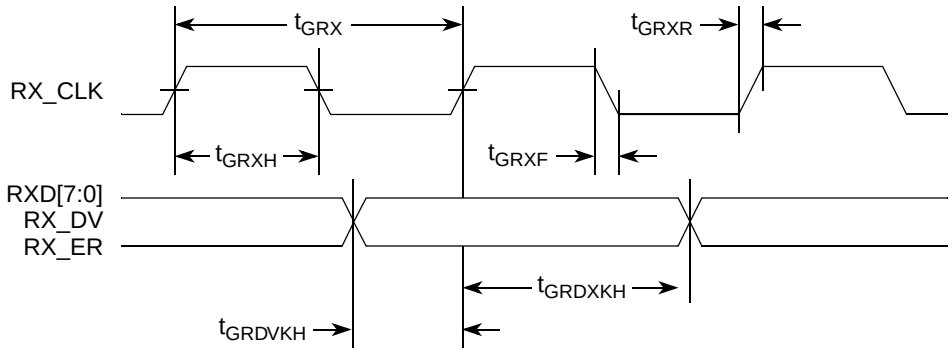

Figure 9. GMII Receive AC Timing Diagram

8.2.2 MII AC Timing Specifications

This section describes the MII transmit and receive AC timing specifications.

8.2.2.1 MII Transmit AC Timing Specifications

Table 25 provides the MII transmit AC timing specifications.

Table 25. MII Transmit AC Timing Specifications

At recommended operating conditions with LV_{DD} of 3.3 V ± 5%, or LV_{DD}=2.5V ± 5%.

Parameter/Condition	Symbol [1]	Min	Typ	Max	Unit
TX_CLK clock period 10 Mbps	t_{MTX} [2]	—	400	—	ns
TX_CLK clock period 100 Mbps	t_{MTX}	—	40	—	ns
TX_CLK duty cycle	t_{MTXH}/t_{MTX}	35	—	65	%
TX_CLK to MII data TXD[3:0], TX_ER, TX_EN delay	t_{MTKHDX}	1	5	15	ns
TX_CLK data clock rise and fall time	t_{MTXR}, t_{MTXF} [2,3]	1.0	—	4.0	ns

Note:

1. The symbols used for timing specifications herein follow the pattern of $t_{\text{(first two letters of functional block)(signal)(state)(reference)(state)}}$ for inputs and $t_{\text{(first two letters of functional block)(reference)(state)(signal)(state)}}$ for outputs. For example, t_{MTKHDX} symbolizes MII transmit timing (MT) for the time t_{MTX} clock reference (K) going high (H) until data outputs (D) are invalid (X). Note that, in general, the clock reference symbol representation is based on two to three letters representing the clock of a particular functional. For example, the subscript of t_{MTX} represents the MII(M) transmit (TX) clock. For rise and fall times, the latter convention is used with the appropriate letter: R (rise) or F (fall).
2. Signal timings are measured at 0.7 V and 1.9 V voltage levels.
3. Guaranteed by design.

Figure 10 shows the MII transmit AC timing diagram.

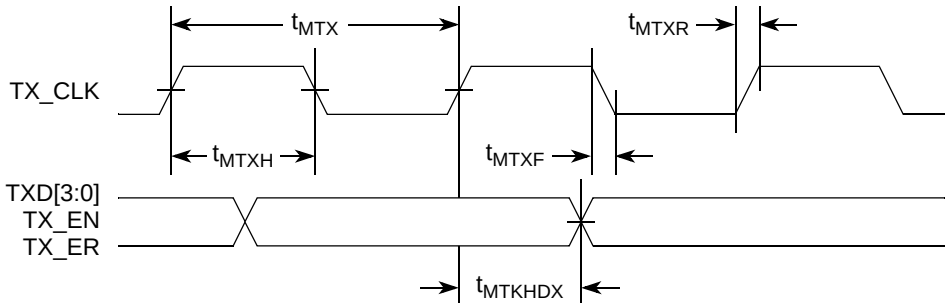

Figure 10. MII Transmit AC Timing Diagram

8.2.2.2 MII Receive AC Timing Specifications

Table 26 provides the MII receive AC timing specifications.

Table 26. MII Receive AC Timing Specifications

At recommended operating conditions with LV_{DD} of 3.3 V ± 5%, or LV_{DD}=2.5V ± 5%.

Parameter/Condition	Symbol [1]	Min	Typ	Max	Unit
RX_CLK clock period 10 Mbps	t_{MRX} [3]	—	400	—	ns
RX_CLK clock period 100 Mbps	t_{MRX}	—	40	—	ns
RX_CLK duty cycle	t_{MRXH}/t_{MRX}	35	—	65	%
RXD[3:0], RX_DV, RX_ER setup time to RX_CLK	t_{MRDVKH}	10.0	—	—	ns
RXD[3:0], RX_DV, RX_ER hold time to RX_CLK	t_{MRDXKH}	10.0	—	—	ns
RX_CLK clock rise and fall time	t_{MRXR}, t_{MRXF} [2,3]	1.0	—	4.0	ns

Note:

1. The symbols used for timing specifications herein follow the pattern of $t_{\text{(first two letters of functional block)(signal)(state)(reference)(state)}}$ for inputs and $t_{\text{(first two letters of functional block)(reference)(state)(signal)(state)}}$ for outputs. For example, t_{MRDVKH} symbolizes MII receive timing (MR) with respect to the time data input signals (D) reach the valid state (V) relative to the t_{MRX} clock reference (K) going to the high (H) state or setup time. Also, t_{MRDXKL} symbolizes MII receive timing (GR) with respect to the time data input signals (D) went invalid (X) relative to the t_{MRX} clock reference (K) going to the low (L) state or hold time. Note that, in general, the clock reference symbol representation is based on three letters representing the clock of a particular functional. For example, the subscript of t_{MRX} represents the MII (M) receive (RX) clock. For rise and fall times, the latter convention is used with the appropriate letter: R (rise) or F (fall).
2. Signal timings are measured at 0.7 V and 1.9 V voltage levels.
3. Guaranteed by design.

Figure 11 shows the MII receive AC timing diagram.

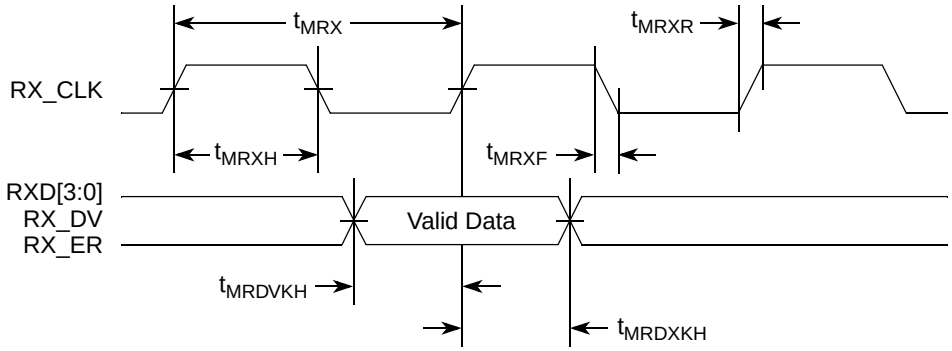

Figure 11. MII Receive AC Timing Diagram

8.2.3 TBI AC Timing Specifications

This section describes the TBI transmit and receive AC timing specifications.

8.2.3.1 TBI Transmit AC Timing Specifications

Table 27 provides the TBI transmit AC timing specifications.

Table 27. TBI Transmit AC Timing Specifications

At recommended operating conditions with LV_{DD} of 3.3 V ± 5%, or LV_{DD}=2.5V ± 5%.

Parameter/Condition	Symbol [1]	Min	Typ	Max	Unit
GTX_CLK clock period	t_{TTX}	—	8.0	—	ns
GTX_CLK duty cycle	t_{TTXH}/t_{TTX}	40	—	60	%
TCG[9:0] setup time GTX_CLK going high	t_{TTKHDV}	2.0	—	—	ns
TCG[9:0] hold time from GTX_CLK going high	t_{TTKHDX}	1.0	—	—	ns
GTX_CLK clock rise and fall time	t_{TTXR}, t_{TTXF} [2,3]	—	—	1.0	ns

Notes:

1. The symbols used for timing specifications herein follow the pattern of $t_{\text{(first two letters of functional block)(signal)(state)(reference)(state)}}$ for inputs and $t_{\text{(first two letters of functional block)(reference)(state)(signal)(state)}}$ for outputs. For example, t_{TTKHDV} symbolizes the TBI transmit timing (TT) with respect to the time from t_{TTX} (K) going high (H) until the referenced data signals (D) reach the valid state (V) or setup time. Also, t_{TTKHDX} symbolizes the TBI transmit timing (TT) with respect to the time from t_{TTX} (K) going high (H) until the referenced data signals (D) reach the invalid state (X) or hold time. Note that, in general, the clock reference symbol representation is based on three letters representing the clock of a particular functional. For example, the subscript of t_{TTX} represents the TBI (T) transmit (TX) clock. For rise and fall times, the latter convention is used with the appropriate letter: R (rise) or F (fall).
2. Signal timings are measured at 0.7 V and 1.9 V voltage levels.
3. Guaranteed by design.

Figure 12 shows the TBI transmit AC timing diagram.

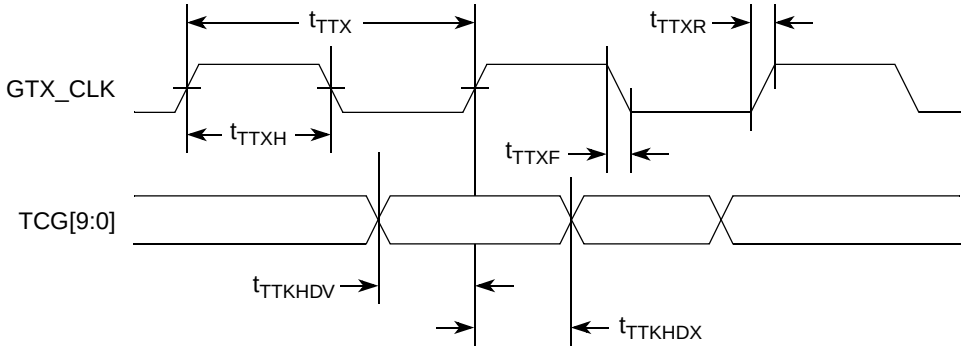

Figure 12. TBI Transmit AC Timing Diagram

8.2.3.2 TBI Receive AC Timing Specifications

Table 28 provides the TBI receive AC timing specifications.

Table 28. TBI Receive AC Timing Specifications

At recommended operating conditions with LV_{DD} of 3.3 V ± 5%, or LV_{DD}=2.5V ± 5%.

Parameter/Condition	Symbol [1]	Min	Typ	Max	Unit
RX_CLK clock period	t_{TRX}		16.0		ns
RX_CLK skew	t_{SKTRX}	7.5	—	8.5	ns
RX_CLK duty cycle	t_{TRXH}/t_{TRX}	40	—	60	%
RCG[9:0] setup time to rising RX_CLK	t_{TRDVKH}	2.5	—	—	ns
RCG[9:0] hold time to rising RX_CLK	t_{TRDXKH}	1.5	—	—	ns
RX_CLK clock rise time and fall time	t_{TRXR}, t_{TRXF} [2,3]	0.7	—	2.4	ns

Note:

1. The symbols used for timing specifications herein follow the pattern of $t_{\text{(first two letters of functional block)(signal)(state)(reference)(state)}}$ for inputs and $t_{\text{(first two letters of functional block)(reference)(state)(signal)(state)}}$ for outputs. For example, t_{TRDVKH} symbolizes TBI receive timing (TR) with respect to the time data input signals (D) reach the valid state (V) relative to the t_{TRX} clock reference (K) going to the high (H) state or setup time. Also, t_{TRDXKH} symbolizes TBI receive timing (TR) with respect to the time data input signals (D) went invalid (X) relative to the t_{TRX} clock reference (K) going to the high (H) state. Note that, in general, the clock reference symbol representation is based on three letters representing the clock of a particular functional. For example, the subscript of t_{TRX} represents the TBI (T) receive (RX) clock. For rise and fall times, the latter convention is used with the appropriate letter: R (rise) or F (fall). For symbols representing skews, the subscript is skew (SK) followed by the clock that is being skewed (TRX).
2. Signal timings are measured at 0.7 V and 1.9 V voltage levels.
3. Guaranteed by design.

Figure 13 shows the TBI receive AC timing diagram.

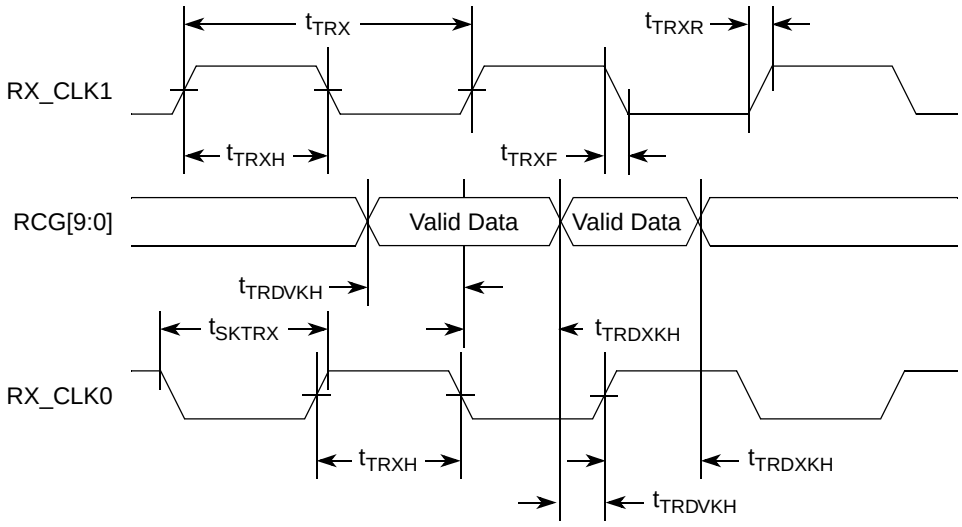

Figure 13. TBI Receive AC Timing Diagram

8.2.4 RGMII and RTBI AC Timing Specifications

Table 29 presents the RGMII and RTBI AC timing specifications.

Table 29. RGMII and RTBI AC Timing Specifications

At recommended operating conditions with LV_{DD} of 2.5 V ± 5%.

Parameter/Condition	Symbol [1]	Min	Typ	Max	Unit
Data to clock output skew (at transmitter)	t_{SKRGT} [5]	–500	0	500	ps
Data to clock input skew (at receiver) [2]	t_{SKRGT}	1.0	—	2.8	ns
Clock period[3]	t_{RGT} [6]	7.2	8.0	8.8	ns
Duty cycle for 1000Base-T [4]	t_{RGTH}/t_{RGT} [6]	45	50	55	%
Duty cycle for 10BASE-T and 100BASE-TX [3]	t_{RGTH}/t_{RGT} [6]	40	50	60	%
Rise and fall time	t_{RGTR}, t_{RGTF} [6,7]	—	—	0.75	ns

Notes:

1. Note that, in general, the clock reference symbol representation for this section is based on the symbols RGT to represent RGMII and RTBI timing. For example, the subscript of t_{RGT} represents the TBI (T) receive (RX) clock. Note also that the notation for rise (R) and fall (F) times follows the clock symbol that is being represented. For symbols representing skews, the subscript is skew (SK) followed by the clock that is being skewed (RGT).
2. The RGMII specification requires that PC board designer add 1.5 ns or greater in trace delay to the RX_CLK in order to meet this specification. However, as stated above, this device will function with only 1.0 ns of delay.
3. For 10 and 100 Mbps, t_{RGT} scales to 400 ns ± 40 ns and 40 ns ± 4 ns, respectively.
4. Duty cycle may be stretched/shrunk during speed changes or while transitioning to a received packet's clock domains as long as the minimum duty cycle is not violated and stretching occurs for no more than three t_{RGT} of the lowest speed transitioned between.
5. Guaranteed by characterization.
6. Guaranteed by design.
7. Signal timings are measured at 0.5 V and 2.0 V voltage levels.

Figure 14 shows the RGMII and RTBI AC timing and multiplexing diagrams.

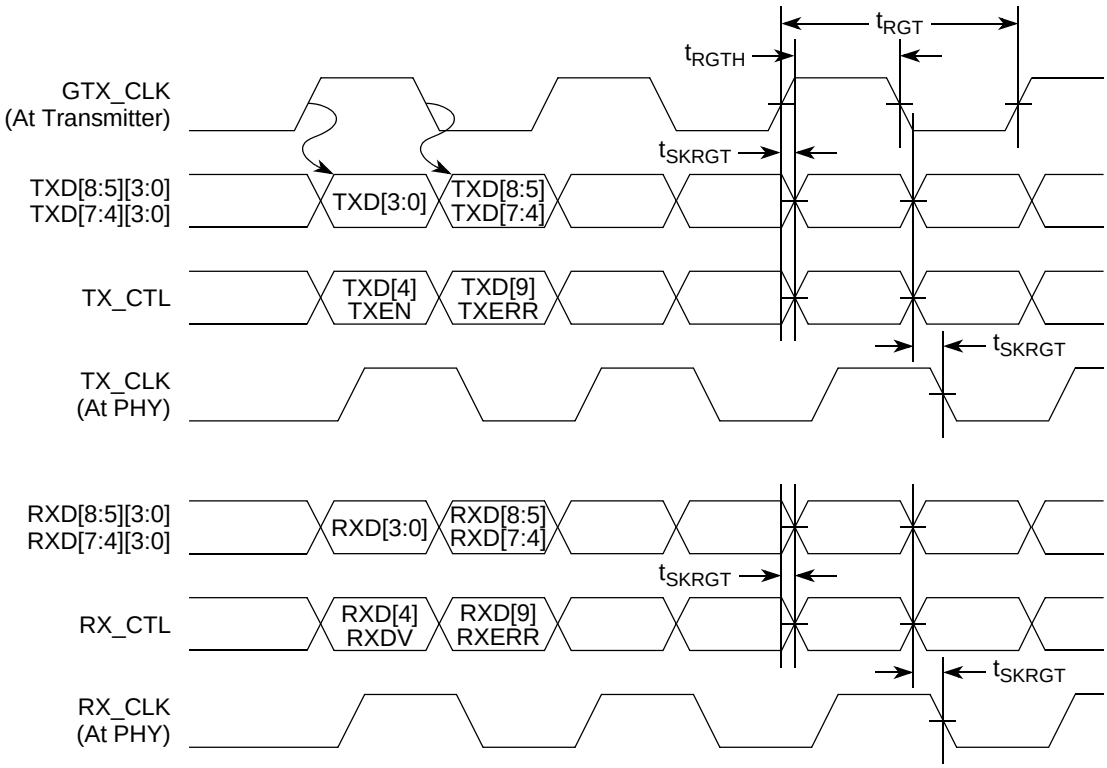

Figure 14. RGMII and RTBI AC Timing and Multiplexing Diagrams

8.3 10/100 Ethernet Controller (10/100 Mbps)—MII Electrical Characteristics

The electrical characteristics specified here apply to the MII (media independent interface) signals except MDIO (management data input/output) and MDC (management data clock). The MII interface can be operated at 3.3 or 2.5 V. Whether the MII interface is operated at 3.3 or 2.5 V, the timing is compliant with the IEEE 802.3 standard. The electrical characteristics for MDIO and MDC are specified in Section 2.1.3, "Recommended Operating Conditions."

8.3.1 MII DC Electrical Characteristics

All MII drivers and receivers comply with the DC parametric attributes specified in Table 30. The potential applied to the input of a MII receiver may exceed the potential of the receiver's power supply (that is, a MII driver powered from a 3.6-V supply driving V_{OH} into a MII receiver powered from a 2.5-V supply). Tolerance for dissimilar MII driver and receiver supply potentials is implicit in these specifications.

Table 30. MII DC Electrical Characteristics

Parameter	Symbol	Min	Max	Unit
Supply voltage 3.3 V	OV_{DD}	3.13	3.47	V
Output high voltage (OV_{DD} = Min, I_{OH} = –4.0 mA)	V_{OH}	2.40	OV_{DD} + 0.3	V
Output low voltage (OV_{DD} = Min, I_{OL} = 4.0 mA)	V_{OL}	GND	0.50	V
Input high voltage	V_{IH}	1.70	—	V
Input low voltage	V_{IL}	–0.3	0.90	V
Input high current (V_{IN}= OV_{DD} [1])	I_{IH}	—	40	μA
Input low current (V_{IN}= GND [1])	I_{IL}	–600	—	μA

Note:

1.Note that the symbol V_{IN}, in this case, represents the OV_{IN} symbol referenced in Table 1 and Table 2.

8.3.2 MII AC Electrical Specifications

This section describes the MII transmit and receive AC specifications.

8.3.2.1 MII Transmit AC Timing Specifications

Table 31 provides the MII transmit AC timing specifications.

Table 31. MII Transmit AC Timing Specifications

At recommended operating conditions with OV_{DD} of 3.3 V ± 5%.

Parameter/Condition	Symbol [1]	Min	Typ	Max	Unit
TX_CLK clock period 10 Mbps	t_{MTX}	—	400	—	ns
TX_CLK clock period 100 Mbps	t_{MTX}	—	40	—	ns
TX_CLK duty cycle	t_{MTXH}/t_{MTX}	35	—	65	%
TX_CLK to MII data TXD[3:0], TX_ER, TX_EN delay	t_{MTKHDX}	1	5	15	ns
TX_CLK data clock rise and fall time	t_{MTXR}, t_{MTXF} [2,3]	1.0	—	4.0	ns

Note:

1.The symbols used for timing specifications herein follow the pattern of $t_{\text{(first two letters of functional block)(signal)(state)(reference)(state)}}$ for inputs and $t_{\text{(first two letters of functional block)(reference)(state)(signal)(state)}}$ for outputs. For example, t_{MTKHDX} symbolizes MII transmit timing (MT) from the time t_{MTX} clock reference (K) going high (H) until data outputs (D) are invalid (X). Note that, in general, the clock reference symbol representation is based on two to three letters representing the clock of a particular functional. For example, the subscript of t_{MTX} represents the MII (M) transmit (TX) clock. For rise and fall times, the latter convention is used with the appropriate letter: R (rise) or F (fall).

2.Signal timings are measured at 0.7 V and 1.9 V voltage levels.

3.Guaranteed by design.

Figure 15 shows the MII transmit AC timing diagram.

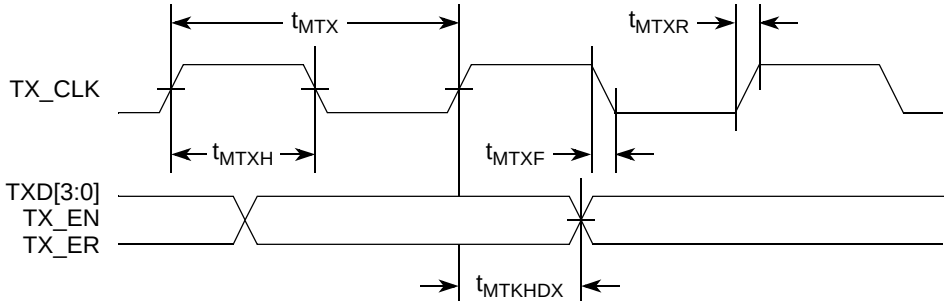

Figure 15. MII Transmit AC Timing Diagram

8.3.2.2 MII Receive AC Timing Specifications

Table 32 provides the MII receive AC timing specifications.

Table 32. MII Receive AC Timing Specifications

Parameter/Condition	Symbol [1]	Min	Typ	Max	Unit
RX_CLK clock period 10 Mbps	t_{MRX}	—	400	—	ns
RX_CLK clock period 100 Mbps	t_{MRX}	—	40	—	ns
RX_CLK duty cycle	t_{MRXH}/t_{MRX}	35	—	65	%
RXD[7:0], TX_DV, TX_ER setup time to RX_CLK	t_{MRDVKH}	10.0	—	—	ns
RXD[7:0], TX_DV, TX_ER hold time to RX_CLK	t_{MRDXKH}	10.0	—	—	ns
RX_CLK clock rise and fall time	t_{MRXR}, t_{MRXF} [2,3]	1.0	—	4.0	ns

Note:

1. The symbols used for timing specifications herein follow the pattern of $t_{\text{(first two letters of functional block)(signal)(state)(reference)(state)}}$ for inputs and $t_{\text{(first two letters of functional block)(reference)(state)(signal)(state)}}$ for outputs. For example, t_{MRDVKH} symbolizes MII receive timing (MR) with respect to the time data input signals (D) reach the valid state (V) relative to the t_{MRX} clock reference (K) going to the high (H) state or setup time. Also, t_{MRDXKH} symbolizes MII receive timing (GR) with respect to the time data input signals (D) went invalid (X) relative to the t_{MRX} clock reference (K) going to the high (H) state or hold time. Note that, in general, the clock reference symbol representation is based on two to three letters representing the clock of a particular functional. For example, the subscript of t_{MRX} represents the MII (M) receive (RX) clock. For rise and fall times, the latter convention is used with the appropriate letter: R (rise) or F (fall).
2. Signal timings are measured at 0.7 V and 1.9 V voltage levels.
3. Guaranteed by design.

Figure 16 shows the MII receive AC timing diagram.

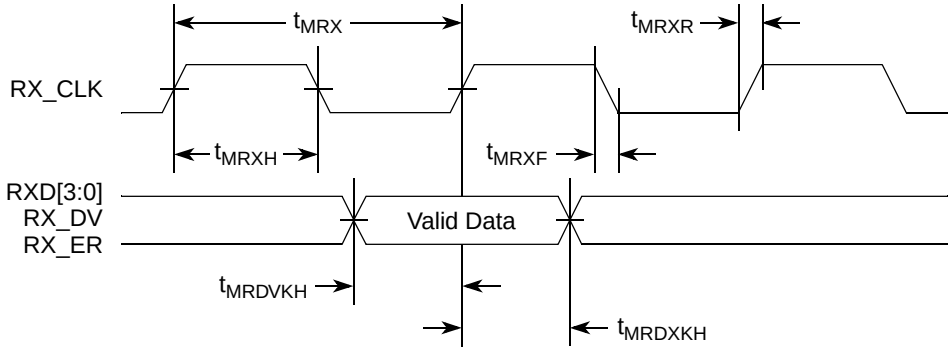

Figure 16. MII Receive AC Timing Diagram

8.4 Ethernet Management Interface Electrical Characteristics

The electrical characteristics specified here apply to MII management interface signals MDIO (management data input/output) and MDC (management data clock). The electrical characteristics for GMII, RGMII, TBI and RTBI are specified in Section 8.1, "Three-Speed Ethernet Controller (TSEC) (10/100/1Gb Mbps)—GMII/MII/TBI/RGMII/RTBI Electrical Characteristics."

8.4.1 MII Management DC Electrical Characteristics

The MDC and MDIO are defined to operate at a supply voltage of 3.3 V. The DC electrical characteristics for MDIO and MDC are provided in Table 33.

Table 33. MII Management DC Electrical Characteristics

Parameter	Symbol	Min	Max	Unit
Supply voltage (3.3 V)	OV_{DD}	3.13	3.47	V
Output high voltage (OV_{DD} = Min, I_{OH} = –1.0 mA)	V_{OH}	2.10	OV_{DD} + 0.3	V
Output low voltage (OV_{DD} = Min, I_{OL} = 1.0 mA)	V_{OL}	GND	0.50	V
Input high voltage	V_{IH}	1.70	—	V
Input low voltage	V_{IL}	—	0.90	V
Input high current (OV_{DD} = Max, V_{IN} [1] = 2.1 V)	I_{IH}	—	40	μA
Input low current (OV_{DD} = Max, V_{IN} = 0.5 V)	I_{IL}	–600	—	μA

Note:

1.Note that the symbol V_{IN}, in this case, represents the OV_{IN} symbol referenced in Table 1 and Table 2.

8.4.2 MII Management AC Electrical Specifications

Table 34 provides the MII management AC timing specifications.

Table 34. MII Management AC Timing Specifications

At recommended operating conditions with OV_{DD} is 3.3 V ± 5%.

Parameter/Condition	Symbol [1]	Min	Typ	Max	Unit	Notes
MDC frequency	f_{MDC}	0.893	—	10.4	MHz	2, 4
MDC period	t_{MDC}	96	—	1120	ns	
MDC clock pulse width high	t_{MDCH}	32	—	—	ns	
MDC to MDIO valid	t_{MDKHDV}			$2*[1/(f_{ccb\_clk}/8)]$	ns	3
MDC to MDIO delay	t_{MDKHDX}	10	—	$2*[1/(f_{ccb\_clk}/8)]$	ns	3
MDIO to MDC setup time	t_{MDDVKH}	5	—	—	ns	
MDIO to MDC hold time	t_{MDDXKH}	0	—	—	ns	
MDC rise time	t_{MDCR}	—	—	10	ns	4
MDC fall time	t_{MDHF}	—	—	10	ns	4

Notes:

1. The symbols used for timing specifications herein follow the pattern of $t_{\text{(first two letters of functional block)(signal)(state)(reference)(state)}}$ for inputs and $t_{\text{(first two letters of functional block)(reference)(state)(signal)(state)}}$ for outputs. For example, t_{MDKHDX} symbolizes management data timing (MD) for the time t_{MDC} from clock reference (K) high (H) until data outputs (D) are invalid (X) or data hold time. Also, t_{MDDVKH} symbolizes management data timing (MD) with respect to the time data input signals (D) reach the valid state (V) relative to the t_{MDC} clock reference (K) going to the high (H) state or setup time. For rise and fall times, the latter convention is used with the appropriate letter: R (rise) or F (fall).
2. This parameter is dependent on the CCB clock speed (that is, for a CCB clock of 267 MHz, the maximum frequency is 8.3 MHz and the minimum frequency is 1.2 MHz; for a CCB clock of 333 MHz, the maximum frequency is 10.4 MHz and the minimum frequency is 1.5 MHz).
3. This parameter is dependent on the CCB clock speed (that is, for a CCB clock of 267 MHz, the delay is 60 ns and for a CCB clock of 333 MHz, the delay is 48 ns).
4. Guaranteed by design.

Figure 17 shows the MII management AC timing diagram.

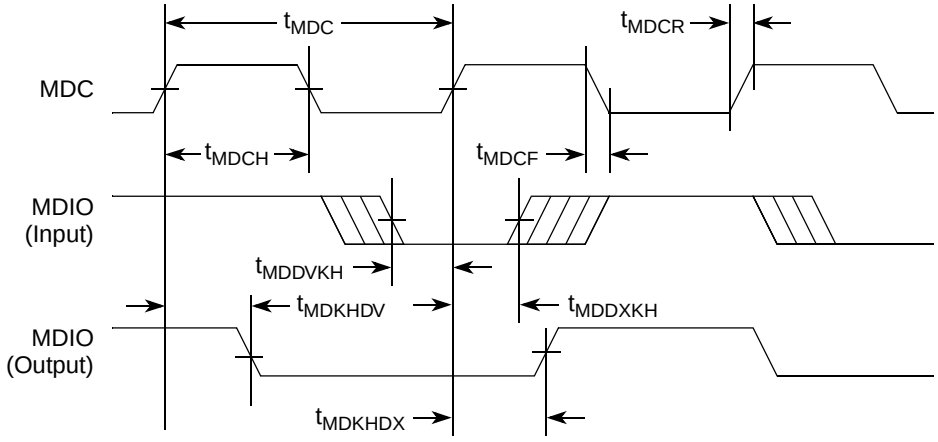

Figure 17. MII Management Interface Timing Diagram

9 Local Bus

This section describes the DC and AC electrical specifications for the local bus interface of the MPC8540.

9.1 Local Bus DC Electrical Characteristics

Table 35 provides the DC electrical characteristics for the local bus interface.

Table 35. Local Bus DC Electrical Characteristics

Parameter	Symbol	Min	Max	Unit
High-level input voltage	V_{IH}	2	OV_{DD} + 0.3	V
Low-level input voltage	V_{IL}	–0.3	0.8	V
Input current (V_{IN} [1] = 0 V or V_{IN} = V_{DD})	I_{IN}	—	±5	μA
High-level output voltage (OV_{DD} = min, I_{OH} = –2 mA)	V_{OH}	OV_{DD} - 0.2	—	V
Low-level output voltage (OV_{DD} = min, I_{OL} = 2 mA)	V_{OL}	—	0.2	V

Note:

1.Note that the symbol V_{IN}, in this case, represents the OV_{IN} symbol referenced in Table 1 and Table 2.

9.2 Local Bus AC Electrical Specifications

Table 36 describes the general timing parameters of the local bus interface of the MPC8540 with the DLL enabled.

Table 36. Local Bus General Timing Parameters - DLL Enabled

Parameter	POR Configuration	Symbol [1]	Min	Max	Unit	Notes
Local bus cycle time		t_{LBK}	6.0	—	ns	2
LCLK[n] skew to LCLK[m] or LSYNC_OUT		$t_{LBKSKEW}$	—	150	ps	3, 9
Input setup to local bus clock (except LUPWAIT)		$t_{LBIVKH1}$	1.8	—	ns	4, 5, 8
LUPWAIT input setup to local bus clock		$t_{LBIVKH2}$	1.7	—	ns	4, 5
Input hold from local bus clock (except LUPWAIT)		$t_{LBIXKH1}$	0.5	—	ns	4, 5, 8
LUPWAIT input hold from local bus clock		$t_{LBIXKH2}$	1.0	—	ns	4, 5
LALE output transition to LAD/LDP output transition (LATCH hold time)		t_{LBOTOT}	1.5	—	ns	6

Table 36. Local Bus General Timing Parameters - DLL Enabled (continued)

Parameter	POR Configuration	Symbol [1]	Min	Max	Unit	Notes
Local bus clock to output valid (except LAD/LDP and LALE)	TSEC2_TXD[6:5] = 00	$t_{LBKHOV1}$	—	2.0	ns	4, 8
	TSEC2_TXD[6:5] = 11 (default)			3.5		
Local bus clock to data valid for LAD/LDP	TSEC2_TXD[6:5] = 00	$t_{LBKHOV2}$	—	2.2	ns	4, 8
	TSEC2_TXD[6:5] = 11 (default)			3.7		
Local bus clock to address valid for LAD	TSEC2_TXD[6:5] = 00	$t_{LBKHOV3}$	—	2.3	ns	4, 8
	TSEC2_TXD[6:5] = 11 (default)			3.8		
Local bus clock to LALE assertion		$t_{LBKHOV4}$	—	2.3	ns	4, 8
Output hold from local bus clock (except LAD/LDP and LALE)	TSEC2_TXD[6:5] = 00	$t_{LBKHOX1}$	0.7	—	ns	4, 8
	TSEC2_TXD[6:5] = 11 (default)		1.6			
Output hold from local bus clock for LAD/LDP	TSEC2_TXD[6:5] = 00	$t_{LBKHOX2}$	0.7	—	ns	4, 8
	TSEC2_TXD[6:5] = 11 (default)		1.6			
Local bus clock to output high Impedance (except LAD/LDP and LALE)	TSEC2_TXD[6:5] = 00	$t_{LBKHOZ1}$	—	2.5	ns	7, 9
	TSEC2_TXD[6:5] = 11 (default)			3.8		
Local bus clock to output high impedance for LAD/LDP	TSEC2_TXD[6:5] = 00	$t_{LBKHOZ2}$	—	2.5	ns	7, 9
	TSEC2_TXD[6:5] = 11 (default)			3.8		

Notes:

1. The symbols used for timing specifications herein follow the pattern of $t_{\text{(First two letters of functional block)(signal)(state)(reference)(state)}}$ for inputs and $t_{\text{(First two letters of functional block)(reference)(state)(signal)(state)}}$ for outputs. For example, $t_{LBIXKH1}$ symbolizes local bus timing (LB) for the input (I) to go invalid (X) with respect to the time the t_{LBK} clock reference (K) goes high (H), in this case for clock one(1). Also, t_{LBKHOX} symbolizes local bus timing (LB) for the t_{LBK} clock reference (K) to go high (H), with respect to the output (O) going invalid (X) or output hold time.
2. All timings are in reference to LSYNC_IN for DLL enabled mode.
3. Maximum possible clock skew between a clock LCLK[m] and a relative clock LCLK[n]. Skew measured between complementary signals at $OV_{DD}/2$.
4. All signals are measured from $OV_{DD}/2$ of the rising edge of LSYNC_IN for DLL enabled to $0.4 \times OV_{DD}$ of the signal in question for 3.3-V signaling levels.
5. Input timings are measured at the pin.
6. The value of t_{LBOTOT} is defined as the sum of 1/2 or 1 ccb_clk cycle as programmed by LBCR[AHD], and the number of local bus buffer delays used as programmed at power-on reset with configuration pins TSEC2_TXD[6:5].
7. For purposes of active/float timing measurements, the Hi-Z or off state is defined to be when the total current delivered through the component pin is less than or equal to the leakage current specification.
8. Guaranteed by characterization.
9. Guaranteed by design.

Table 37 describes the general timing parameters of the local bus interface of the MPC8540 with the DLL bypassed.

Table 37. Local Bus General Timing Parameters—DLL Bypassed

Parameter	POR Configuration	Symbol [1]	Min	Max	Unit	Notes
Local bus cycle time		t_{LBK}	6.0	—	ns	2
Internal launch/capture clock to LCLK delay		t_{LBKHKT}	2.3	3.9	ns	8
LCLK[n] skew to LCLK[m] or LSYNC_OUT		$t_{LBKSKEW}$	—	150	ps	3, 9
Input setup to local bus clock (except LUPWAIT)		$t_{LBIVKH1}$	5.7	—	ns	4, 5
LUPWAIT input setup to local bus clock		$t_{LBIVKH2}$	5.6	—	ns	4, 5
Input hold from local bus clock (except LUPWAIT)		$t_{LBIXKH1}$	-1.8	—	ns	4, 5
LUPWAIT input hold from local bus clock		$t_{LBIXKH2}$	-1.3	—	ns	4, 5
LALE output transition to LAD/LDP output transition (LATCH hold time)		t_{LBOTOT}	1.5	—	ns	6
Local bus clock to output valid (except LAD/LDP and LALE)	TSEC2_TXD[6:5] = 00	$t_{LBKLOV1}$	—	-0.3	ns	4
	TSEC2_TXD[6:5] = 11 (default)			1.2		
Local bus clock to data valid for LAD/LDP	TSEC2_TXD[6:5] = 00	$t_{LBKLOV2}$	—	-0.1	ns	4
	TSEC2_TXD[6:5] = 11 (default)			1.4		
Local bus clock to address valid for LAD	TSEC2_TXD[6:5] = 00	$t_{LBKLOV3}$	—	0	ns	4
	TSEC2_TXD[6:5] = 11 (default)			1.5		
Local bus clock to LALE assertion		$t_{LBKHOV4}$	—	0	ns	4
Output hold from local bus clock (except LAD/LDP and LALE)	TSEC2_TXD[6:5] = 00	$t_{LBKLOX1}$	-3.2	—	ns	4
	TSEC2_TXD[6:5] = 11 (default)		-2.3			
Output hold from local bus clock for LAD/LDP	TSEC2_TXD[6:5] = 00	$t_{LBKLOX2}$	-3.2	—	ns	4
	TSEC2_TXD[6:5] = 11 (default)		-2.3			
Local bus clock to output high Impedance (except LAD/LDP and LALE)	TSEC2_TXD[6:5] = 00	$t_{LBKLOZ1}$	—	0.2	ns	7
	TSEC2_TXD[6:5] = 11 (default)			1.5		

Table 37. Local Bus General Timing Parameters—DLL Bypassed (continued)

Parameter	POR Configuration	Symbol [1]	Min	Max	Unit	Notes
Local bus clock to output high impedance for LAD/LDP	TSEC2_TXD[6:5] = 00	$t_{LBKLOZ2}$	—	0.2	ns	7
	TSEC2_TXD[6:5] = 11 (default)			1.5		

Notes:

1. The symbols used for timing specifications herein follow the pattern of $t_{\text{(First two letters of functional block)(signal)(state) (reference)(state)}}$ for inputs and $t_{\text{(First two letters of functional block)(reference)(state)(signal)(state)}}$ for outputs. For example, $t_{LBIXKH1}$ symbolizes local bus timing (LB) for the input (I) to go invalid (X) with respect to the time the t_{LBK} clock reference (K) goes high (H), in this case for clock one(1). Also, t_{LBKHOX} symbolizes local bus timing (LB) for the t_{LBK} clock reference (K) to go high (H), with respect to the output (O) going invalid (X) or output hold time.
2. All timings are in reference to local bus clock for DLL bypass mode. Timings may be negative with respect to the local bus clock because the actual launch and capture of signals is done with the internal launch/capture clock, which precedes LCLK by t_{LBKHKT}.
3. Maximum possible clock skew between a clock LCLK[m] and a relative clock LCLK[n]. Skew measured between complementary signals at $OV_{DD}/2$.
4. All signals are measured from $OV_{DD}/2$ of the rising edge of local bus clock for DLL bypass mode to $0.4 \times OV_{DD}$ of the signal in question for 3.3-V signaling levels.
5. Input timings are measured at the pin.
6. The value of t_{LBOTOT} is defined as the sum of 1/2 or 1 ccb_clk cycle as programmed by LBCR[AHD], and the number of local bus buffer delays used as programmed at power-on reset with configuration pins TSEC2_TXD[6:5].
7. For purposes of active/float timing measurements, the Hi-Z or off state is defined to be when the total current delivered through the component pin is less than or equal to the leakage current specification.
8. Guaranteed by characterization.
9. Guaranteed by design.

10 JTAG

This section describes the AC electrical specifications for the IEEE 1149.1 (JTAG) interface of the MPC8540.

Table 38 provides the JTAG AC timing specifications as defined in Figure 26 through Figure 29.

Table 38. JTAG AC Timing Specifications (Independent of SYSCLK) [1]

At recommended operating conditions (see Table 2).

Parameter	Symbol [2]	Min	Max	Unit	Notes
JTAG external clock frequency of operation	f_{JTG}	0	33.3	MHz	
JTAG external clock cycle time	t_{JTG}	30	—	ns	
JTAG external clock pulse width measured at 1.4 V	t_{JTKHKL}	15	—	ns	
JTAG external clock rise and fall times	t_{JTGR} & t_{JTGF}	0	2	ns	6
$\overline{\text{TRST}}$ assert time	t_{TRST}	25	—	ns	3
Input setup times: Boundary-scan data TMS, TDI	 t_{JTDVKH} t_{JTIVKH}	 4 0	 — —	ns	4
Input hold times: Boundary-scan data TMS, TDI	 t_{JTDXKH} t_{JTIXKH}	 20 25	 — —	ns	4
Valid times: Boundary-scan data TDO	 t_{JTKLDV} t_{JTKLOV}	 4 4	 20 25	ns	5
Output hold times: Boundary-scan data TDO	 t_{JTKLDX} t_{JTKLOX}			ns	5
JTAG external clock to output high impedance: Boundary-scan data TDO	 t_{JTKLDZ} t_{JTKLOZ}	 3 3	 19 9	ns	5, 6

Notes:

1. All outputs are measured from the midpoint voltage of the falling/rising edge of t_{TCLK} to the midpoint of the signal in question. The output timings are measured at the pins. All output timings assume a purely resistive 50-Ω load (see Figure 25). Time-of-flight delays must be added for trace lengths, vias, and connectors in the system.
2. The symbols used for timing specifications herein follow the pattern of $t_{\text{(first two letters of functional block)(signal)(state)(reference)(state)}}$ for inputs and $t_{\text{(first two letters of functional block)(reference)(state)(signal)(state)}}$ for outputs. For example, t_{JTDVKH} symbolizes JTAG device timing (JT) with respect to the time data input signals (D) reaching the valid state (V) relative to the t_{JTG} clock reference (K) going to the high (H) state or setup time. Also, t_{JTDXKH} symbolizes JTAG timing (JT) with respect to the time data input signals (D) went invalid (X) relative to the t_{JTG} clock reference (K) going to the high (H) state. Note that, in general, the clock reference symbol representation is based on three letters representing the clock of a particular functional. For rise and fall times, the latter convention is used with the appropriate letter: R (rise) or F (fall).
3. $\overline{\text{TRST}}$ is an asynchronous level sensitive signal. The setup time is for test purposes only.
4. Non-JTAG signal input timing with respect to t_{TCLK}.
5. Non-JTAG signal output timing with respect to t_{TCLK}.
6. Guaranteed by design.

11 I²C

This section describes the DC and AC electrical characteristics for the I²C interface of the MPC8540.

11.1 I²C DC Electrical Characteristics

Table 39 provides the DC electrical characteristics for the I²C interface of the MPC8540.

Table 39. I²C DC Electrical Characteristics

At recommended operating conditions with OV_{DD} of 3.3 V ± 5%.

Parameter	Symbol	Min	Max	Unit	Notes
Input high voltage level	V_{IH}	$0.7 \times OV_{DD}$	OV_{DD}+ 0.3	V	
Input low voltage level	V_{IL}	–0.3	$0.3 \times OV_{DD}$	V	
Low level output voltage	V_{OL}	0	$0.2 \times OV_{DD}$	V	1
Pulse width of spikes which must be suppressed by the input filter	t_{I2KHKL}	0	50	ns	2
Input current each I/O pin (input voltage is between $0.1 \times OV_{DD}$ and $0.9 \times OV_{DD}$(max)	I_I	–10	10	μA	3
Capacitance for each I/O pin	C_I	—	10	pF	

Notes:

1.Output voltage (open drain or open collector) condition = 3 mA sink current.

2.Refer to the *MPC8540 Integrated Processor Preliminary Reference Manual* for information on the digital filter used.

3.I/O pins will obstruct the SDA and SCL lines if OV_{DD} is switched off.

11.2 I²C AC Electrical Specifications

Table 40 provides the AC timing parameters for the I²C interface of the MPC8540.

Table 40. I²C AC Electrical Specifications

All values refer to V_{IH} (min) and V_{IL} (max) levels (see Table 39).

Parameter	Symbol [1]	Min	Max	Unit
SCL clock frequency	f_{I2C}	0	400	kHz
Low period of the SCL clock	t_{I2CL} [6]	1.3	—	μs
High period of the SCL clock	t_{I2CH} [6]	0.6	—	μs
Setup time for a repeated START condition	t_{I2SVKH} [6]	0.6	—	μs
Hold time (repeated) START condition (after this period, the first clock pulse is generated)	t_{I2SXKL} [6]	0.6	—	μs
Data setup time	t_{I2DVKH} [6]	100	—	ns
Data hold time: CBUS compatible masters I²C bus devices	t_{I2DXKL}	— 0 [2]	— 0.9 [3]	μs
Set-up time for STOP condition	t_{I2PVKH}	0.6	—	μs
Bus free time between a STOP and START condition	t_{I2KHDX}	1.3	—	μs
Noise margin at the LOW level for each connected device (including hysteresis)	V_{NL}	$0.1 \times OV_{DD}$	—	V
Noise margin at the HIGH level for each connected device (including hysteresis)	V_{NH}	$0.2 \times OV_{DD}$	—	V

Notes:

1. The symbols used for timing specifications herein follow the pattern of $t_{\text{(first two letters of functional block)(signal)(state)(reference)(state)}}$ for inputs and $t_{\text{(first two letters of functional block)(reference)(state)(signal)(state)}}$ for outputs. For example, t_{I2DVKH} symbolizes I²C timing (I2) with respect to the time data input signals (D) reach the valid state (V) relative to the t_{I2C} clock reference (K) going to the high (H) state or setup time. Also, t_{I2SXKL} symbolizes I²C timing (I2) for the time that the data with respect to the start condition (S) went invalid (X) relative to the t_{I2C} clock reference (K) going to the low (L) state or hold time. Also, t_{I2PVKH} symbolizes I²C timing (I2) for the time that the data with respect to the stop condition (P) reaching the valid state (V) relative to the t_{I2C} clock reference (K) going to the high (H) state or setup time. For rise and fall times, the latter convention is used with the appropriate letter: R (rise) or F (fall).
2. MPC8540 provides a hold time of at least 300 ns for the SDA signal (referred to the V_{IHmin} of the SCL signal) to bridge the undefined region of the falling edge of SCL.
3. The maximum t_{I2DVKH} has only to be met if the device does not stretch the LOW period (t_{I2CL}) of the SCL signal.
4. C_B = capacitance of one bus line in pF.
6. Guaranteed by design.

Figure 18 provides the AC test load for the I²C.

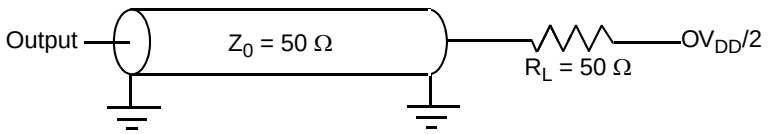

Figure 30. I²C AC Test Load

Figure 31 shows the AC timing diagram for the I^2C bus.

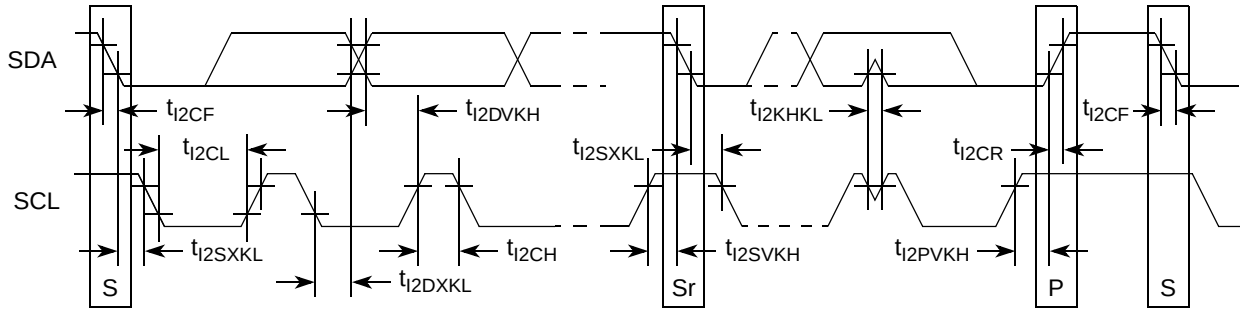

Figure 31. I^2C Bus AC Timing Diagram

12 PCI/PCI-X

This section describes the DC and AC electrical specifications for the PCI/PCI-X bus of the MPC8540.

12.1 PCI/PCI-X DC Electrical Characteristics

Table 41 provides the DC electrical characteristics for the PCI/PCI-X interface of the MPC8540.

Table 41. PCI/PCI-X DC Electrical Characteristics [1]

Parameter	Symbol	Min	Max	Unit
High-level input voltage	V_{IH}	2	OV_{DD} + 0.3	V
Low-level input voltage	V_{IL}	–0.3	0.8	V
Input current (V_{IN} [2] = 0 V or V_{IN} = V_{DD})	I_{IN}	—	±5	μA
High-level output voltage (OV_{DD} = min, I_{OH} = –100 μA)	V_{OH}	OV_{DD} – 0.2	—	V
Low-level output voltage (OV_{DD} = min, I_{OL} = 100 μA)	V_{OL}	—	0.2	V

Notes:

1.Ranges listed do not meet the full range of the DC specifications of the *PCI 2.2 Local Bus Specifications*.

2.Note that the symbol V_{IN}, in this case, represents the OV_{IN} symbol referenced in Table 1 and Table 2.

12.2 PCI/PCI-X AC Electrical Specifications

This section describes the general AC timing parameters of the PCI/PCI-X bus of the MPC8540. Note that the SYSCLK signal is used as the PCI input clock. Table 42 provides the PCI AC timing specifications at 66 MHz.

Table 42. PCI AC Timing Specifications at 66 MHz

Parameter	Symbol [1]	Min	Max	Unit	Notes
SYSCLK to output valid	t_{PCKHOV}	—	6.0	ns	2
Output hold from SYSCLK	t_{PCKHOX}	2.0	—	ns	2, 9
SYSCLK to output high impedance	t_{PCKHOZ}	—	14	ns	2, 3, 10
Input setup to SYSCLK	t_{PCIVKH}	3.0	—	ns	2, 4, 9
Input hold from SYSCLK	t_{PCIXKH}	0	—	ns	2, 4, 9
$\overline{\text{REQ64}}$ to $\overline{\text{HRESET}}$ [9] setup time	t_{PCRVRH}	$10 \times t_{SYS}$	—	clocks	5, 6, 10
$\overline{\text{HRESET}}$ to $\overline{\text{REQ64}}$ hold time	t_{PCRHRX}	0	50	ns	6, 10
$\overline{\text{HRESET}}$ high to first $\overline{\text{FRAME}}$ assertion	t_{PCRHFV}	10	—	clocks	7, 10

Notes:

1. Note that the symbols used for timing specifications herein follow the pattern of $t_{\text{(first two letters of functional block)(signal)(state) (reference)(state)}}$ for inputs and $t_{\text{(first two letters of functional block)(reference)(state)(signal)(state)}}$ for outputs. For example, t_{PCIVKH} symbolizes PCI/PCI-X timing (PC) with respect to the time the input signals (I) reach the valid state (V) relative to the SYSCLK clock, t_{SYS}, reference (K) going to the high (H) state or setup time. Also, t_{PCRHFV} symbolizes PCI/PCI-X timing (PC) with respect to the time hard reset (R) went high (H) relative to the frame signal (F) going to the valid (V) state.
2. See the timing measurement conditions in the *PCI 2.2 Local Bus Specifications*.
3. For purposes of active/float timing measurements, the Hi-Z or off state is defined to be when the total current delivered through the component pin is less than or equal to the leakage current specification.
4. Input timings are measured at the pin.
5. The timing parameter t_{SYS} indicates the minimum and maximum CLK cycle times for the various specified frequencies. The system clock period must be kept within the minimum and maximum defined ranges. For values see Section 15, "Clocking."
6. The setup and hold time is with respect to the rising edge of $\overline{\text{HRESET}}$.
7. The timing parameter t_{PCRHFV} is a minimum of 10 clocks rather than the minimum of 5 clocks in the *PCI 2.2 Local Bus Specifications*.
8. The reset assertion timing requirement for $\overline{\text{HRESET}}$ is 100 μs.
9. Guaranteed by characterization.
10. Guaranteed by design.

Figure 18 provides the AC test load for PCI and PCI-X.

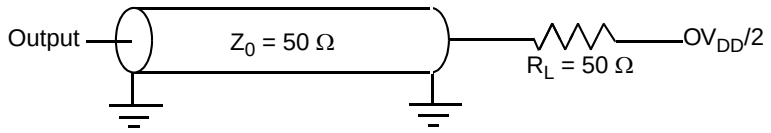

Figure 32. PCI/PCI-X AC Test Load

Figure 33 shows the PCI/PCI-X input AC timing conditions.

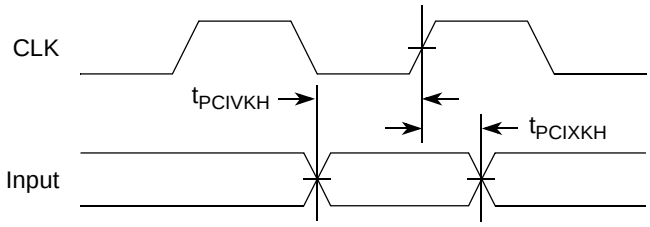

Figure 33. PCI-PCI-X Input AC Timing Measurement Conditions

Figure 34 shows the PCI/PCI-X output AC timing conditions.

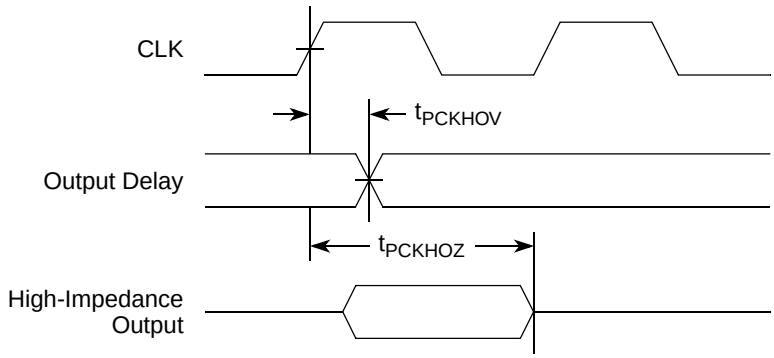

Figure 34. PCI-PCI-X Output AC Timing Measurement Condition

Table 43 provides the PCI-X AC timing specifications at 66 MHz.

Table 43. PCI-X AC Timing Specifications at 66 MHz

Parameter	Symbol	Min	Max	Unit	Notes
SYSCLK to signal valid delay	t_{PCKHOV}	—	3.8	ns	1, 2, 3, 7, 8
Output hold from SYSCLK	t_{PCKHOX}	0.7	—	ns	1, 10
SYSCLK to output high impedance	t_{PCKHOZ}	—	7	ns	1, 4, 8, 11
Input setup time to SYSCLK	t_{PCIVKH}	1.7	—	ns	3, 5
Input hold time from SYSCLK	t_{PCIXKH}	0.5	—	ns	10
$\overline{\text{REQ64}}$ to $\overline{\text{HRESET}}$ setup time	t_{PCRVRH}	10	—	clocks	11
$\overline{\text{HRESET}}$ to $\overline{\text{REQ64}}$ hold time	t_{PCRHRX}	0	50	ns	11
$\overline{\text{HRESET}}$ high to first $\overline{\text{FRAME}}$ assertion	t_{PCRHFV}	10	—	clocks	9, 11

Table 43. PCI-X AC Timing Specifications at 66 MHz (continued)

Parameter	Symbol	Min	Max	Unit	Notes
PCI-X initialization pattern to $\overline{\text{HRESET}}$ setup time	t_{PCIVRH}	10	—	clocks	11
$\overline{\text{HRESET}}$ to PCI-X initialization pattern hold time	t_{PCRHIX}	0	50	ns	6, 11

Notes:

1.See the timing measurement conditions in the *PCI-X 1.0a Specification*.

2.Minimum times are measured at the package pin (not the test point). Maximum times are measured with the test point and load circuit.

3.Setup time for point-to-point signals applies to $\overline{\text{REQ}}$ and $\overline{\text{GNT}}$ only. All other signals are bused.

4.For purposes of active/float timing measurements, the Hi-Z or off state is defined to be when the total current delivered through the component pin is less than or equal to the leakage current specification.

5.Setup time applies only when the device is not driving the pin. Devices cannot drive and receive signals at the same time.

6.Maximum value is also limited by delay to the first transaction (time for $\overline{\text{HRESET}}$ high to first configuration access, t_{PCRHFV}). The PCI-X initialization pattern control signals after the rising edge of $\overline{\text{HRESET}}$ must be negated no later than two clocks before the first $\overline{\text{FRAME}}$ and must be floated no later than one clock before $\overline{\text{FRAME}}$ is asserted.

7.A PCI-X device is permitted to have the minimum values shown for t_{PCKHOV} and t_{CYC} only in PCI-X mode. In conventional mode, the device must meet the requirements specified in PCI 2.2 for the appropriate clock frequency.

8.Device must meet this specification independent of how many outputs switch simultaneously.

9.The timing parameter t_{PCRHFV} is a minimum of 10 clocks rather than the minimum of 5 clocks in the *PCI-X 1.0a Specification.*

10.Guaranteed by characterization.

11.Guaranteed by design.

Table 44 provides the PCI-X AC timing specifications at 133 MHz.

Table 44. PCI-X AC Timing Specifications at 133 MHz

Parameter	Symbol	Min	Max	Unit	Notes
SYSCLK to signal valid delay	t_{PCKHOV}	—	3.8	ns	1, 2, 3, 7, 8
Output hold from SYSCLK	t_{PCKHOX}	0.7	—	ns	1, 11
SYSCLK to output high impedance	t_{PCKHOZ}	—	7	ns	1, 4, 8, 12
Input setup time to SYSCLK	t_{PCIVKH}	1.4	—	ns	3, 5, 9, 11
Input hold time from SYSCLK	t_{PCIXKH}	0.5	—	ns	11
$\overline{\text{REQ64}}$ to $\overline{\text{HRESET}}$ setup time	t_{PCRVRH}	10	—	clocks	12
$\overline{\text{HRESET}}$ to $\overline{\text{REQ64}}$ hold time	t_{PCRHRX}	0	50	ns	12
$\overline{\text{HRESET}}$ high to first $\overline{\text{FRAME}}$ assertion	t_{PCRHFV}	10	—	clocks	10, 12
PCI-X initialization pattern to $\overline{\text{HRESET}}$ setup time	t_{PCIVRH}	10	—	clocks	12

Table 44. PCI-X AC Timing Specifications at 133 MHz (continued)

Parameter	Symbol	Min	Max	Unit	Notes
$\overline{\text{HRESET}}$ to PCI-X initialization pattern hold time	t_{PCRHIX}	0	50	ns	6, 12

Notes:

1. See the timing measurement conditions in the *PCI-X 1.0a Specification*.
2. Minimum times are measured at the package pin (not the test point). Maximum times are measured with the test point and load circuit.
3. Setup time for point-to-point signals applies to $\overline{\text{REQ}}$ and $\overline{\text{GNT}}$ only. All other signals are bused.
4. For purposes of active/float timing measurements, the Hi-Z or off state is defined to be when the total current delivered through the component pin is less than or equal to the leakage current specification.
5. Setup time applies only when the device is not driving the pin. Devices cannot drive and receive signals at the same time.
6. Maximum value is also limited by delay to the first transaction (time for $\overline{\text{HRESET}}$ high to first configuration access, t_{PCRHFV}). The PCI-X initialization pattern control signals after the rising edge of $\overline{\text{HRESET}}$ must be negated no later than two clocks before the first $\overline{\text{FRAME}}$ and must be floated no later than one clock before $\overline{\text{FRAME}}$ is asserted.
7. A PCI-X device is permitted to have the minimum values shown for t_{PCKHOV} and t_{CYC} only in PCI-X mode. In conventional mode, the device must meet the requirements specified in PCI 2.2 for the appropriate clock frequency.
8. Device must meet this specification independent of how many outputs switch simultaneously.
9. The timing parameter t_{PCIVKH} is a minimum of 1.4 ns rather than the minimum of 1.2 ns in the *PCI-X 1.0a Specification.*
10. The timing parameter t_{PCRHFV} is a minimum of 10 clocks rather than the minimum of 5 clocks in the *PCI-X 1.0a Specification.*
11. Guaranteed by characterization.
12. Guaranteed by design.

13 RapidIO

This section describes the DC and AC electrical specifications for the RapidIO interface of the MPC8540.

13.1 RapidIO DC Electrical Characteristics

RapidIO driver and receiver DC electrical characteristics are provided in Table 45 and Table 46, respectively.

Table 45. RapidIO 8/16 LP-LVDS Driver DC Electrical Characteristics

At recommended operating conditions with OV_{DD} of 3.3 V ± 5%.

Characteristic	Symbol	Min	Max	Unit	Notes
Differential output high voltage	V_{OHD}	247	454	mV	1, 2
Differential output low voltage	V_{OLD}	–454	–247	mV	1, 2
Differential offset voltage	ΔV_{OSD}	—	50	mV	1,3
Output high common mode voltage	V_{OHCM}	1.125	1.375	V	1, 4
Output low common mode voltage	V_{OLCM}	1.125	1.375	V	1, 5

Table 45. RapidIO 8/16 LP-LVDS Driver DC Electrical Characteristics (continued)

At recommended operating conditions with OV_{DD} of 3.3 V ± 5%.

Characteristic	Symbol	Min	Max	Unit	Notes
Common mode offset voltage	ΔV_{OSCM}	—	50	mV	1, 6
Differential termination	R_{TERM}	90	220	W	
Short circuit current (either output)	$\lvert I_{SS} \rvert$	—	24	mA	7
Bridged short circuit current	$\lvert I_{SB} \rvert$	—	12	mA	8

Notes:

1.Bridged 100-Ω load.

2.See Figure 35(a).

3.Differential offset voltage = $\lvert V_{OHD}+V_{OLD} \rvert$. See Figure 35(b).

4.$V_{OHCM} = (V_{OA} + V_{OB})/2$ when measuring V_{OHD}.

5.$V_{OLCM} = (V_{OA} + V_{OB})/2$ when measuring V_{OLD}.

6.Common mode offset $\Delta V_{OSCM} = \lvert V_{OHCM} - V_{OLCM} \rvert$. See Figure 35(c).

7.Outputs shorted to V_{DD} or GND.

8.Outputs shorted together.

Table 46. RapidIO 8/16 LP-LVDS Receiver DC Electrical Characteristics

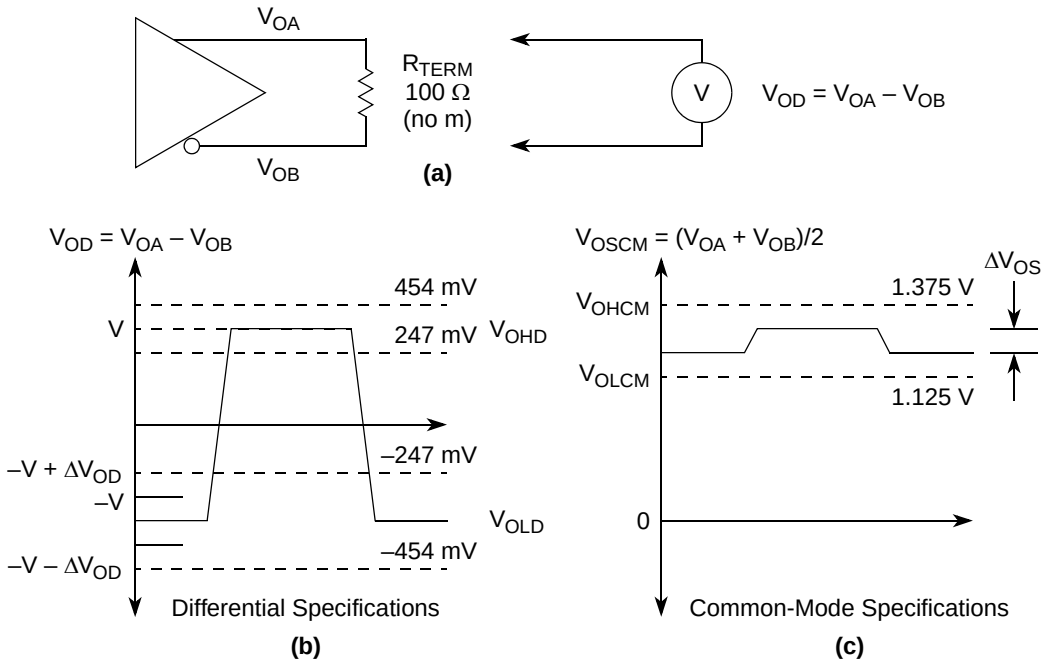
Characteristic	Symbol	Min	Max	Unit	Notes
Voltage at either input	V_I	0	2.4	V	
Differential input high voltage	V_{IHD}	100	600	mV	1
Differential input low voltage	V_{ILD}	–600	–100	mV	1
Common mode input range (referenced to receiver ground)	V_{ICM}	0.050	2.350	V	2
Input differential resistance	R_{IN}	90	110	W	

Notes:

1.Over the common mode range.

2.Limited by V_I. See Figure 42.

Figure 35 shows the DC driver signal levels.



Note: V_{OA} refers to voltage at output A; V_{OB} refers to voltage at output B.

Figure 35. DC Driver Signal Levels

13.2 RapidIO AC Electrical Specifications

This section contains the AC electrical specifications for a RapidIO 8/16 LP-LVDS device. The interface defined is a parallel differential low-power high-speed signal interface. Note that the source of the transmit clock on the RapidIO interface is dependent on the settings of the LGPL[0:1] signals at reset. Note that the default setting makes the core complex bus (CCB) clock the source of the transmit clock. See Chapter 4 of the Reference Manual for more details on reset configuration settings.

13.3 RapidIO Concepts and Definitions

This section specifies signals using differential voltages. Figure 36 shows how the signals are defined. The figure shows waveforms for either a transmitter output (TD and $\overline{\text{TD}}$) or a receiver input (RD and $\overline{\text{RD}}$). Each signal swings between A volts and B volts where A > B. Using these waveforms, the definitions are as follows:

- The transmitter output and receiver input signals TD, $\overline{\text{TD}}$, RD, and $\overline{\text{RD}}$ each have a peak-to-peak swing of A-B volts.
- The differential output signal of the transmitter, V_{OD}, is defined as $V_{TD} - V_{\overline{TD}}$.
- The differential input signal of the receiver, V_{ID}, is defined as $V_{RD} - V_{\overline{RD}}$.
- The differential output signal of the transmitter or input signal of the receiver, ranges from A – B volts to – (A – B) volts.

- The peak differential signal of the transmitter output or receiver input, is A – B volts.
- The peak-to-peak differential signal of the transmitter output or receiver input, is 2 × (A – B) volts.

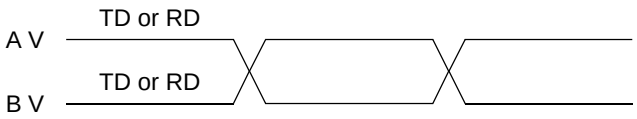


Figure 36. Differential Peak-to-Peak Voltage of Transmitter or Receiver

To illustrate these definitions using numerical values, consider the case where a LVDS transmitter has a common mode voltage of 1.2 V and each signal has a swing that goes between 1.4 and 1.0 V. Using these values, the peak-to-peak voltage swing of the signals TD, $\overline{\text{TD}}$, RD, and $\overline{\text{RD}}$ is 400 mV. The differential signal ranges between 400 and –400 mV. The peak differential signal is 400 mV, and the peak-to-peak differential signal is 800 mV.

A timing edge is the zero-crossing of a differential signal. Each skew timing parameter on a parallel bus is synchronously measured on two signals relative to each other in the same cycle, such as data to data, data to clock, or clock to clock. A skew timing parameter may be relative to the edge of a signal or to the middle of two sequential edges.

Static skew represents the timing difference between signals that does not vary over time regardless of system activity or data pattern. Path length differences are a primary source of static skew.

Dynamic skew represents the amount of timing difference between signals that is dependent on the activity of other signals and varies over time. Crosstalk between signals is a source of dynamic skew.

Eye diagrams and compliance masks are a useful way to visualize and specify driver and receiver performance. This technique is used in several serial bus specifications. An example compliance mask is shown in Figure 37. The key difference in the application of this technique for a parallel bus is that the data is source synchronous to its bus clock while serial data is referenced to its embedded clock. Eye diagrams reveal the quality (cleanness, openness, goodness) of a driver output or receiver input. An advantage of using an eye diagram and a compliance mask is that it allows specifying the quality of a signal without requiring separate specifications for effects such as rise time, duty cycle distortion, data dependent dynamic skew, random dynamic skew, etc. This allows the individual semiconductor manufacturer maximum flexibility to trade off various performance criteria while keeping the system performance constant.

In using the eye pattern and compliance mask approach, the quality of the signal is specified by the compliance mask. The mask specifies the maximum permissible magnitude of the signal and the minimum permissible eye opening. The eye diagram for the signal under test is generated according to the specification. Compliance is determined by whether the compliance mask can be positioned over the eye diagram such that the eye pattern falls entirely within the unshaded portion of the mask.

Serial specifications have clock encoded with the data, but the LP-LVDS physical layer defined by RapidIO is a source synchronous parallel port so additional specifications to include effects that are not found in serial links are required. Specifications for the effect of bit to bit timing differences caused by static skew have been added and the eye diagrams specified are measured relative to the associated clock in order to include clock to data effects. With the transmit output (or receiver input) eye diagram, the user can determine if the transmitter output (or receiver input) is compliant with an oscilloscope with the appropriate software.

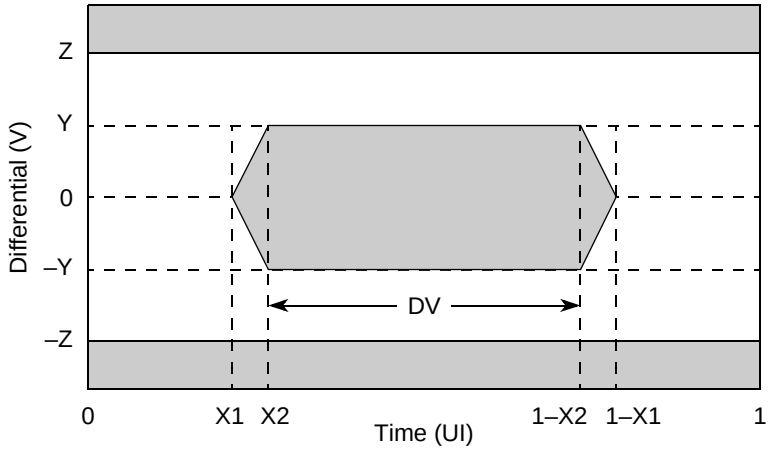

Figure 37. Example Compliance Mask

Y = minimum data valid amplitude

Z = maximum amplitude

1 UI = 1 unit interval = 1/baud rate

X1 = end of zero crossing region

X2 = beginning of data valid window

DV = data valid window = 1 – 2 × X2

The waveform of the signal under test must fall within the unshaded area of the mask to be compliant. Different masks are used for the driver output and the receiver input allowing each to be separately specified.

13.3.1 RapidIO Driver AC Timing Specifications

Driver AC timing specifications are provided in Table 47, Table 48, and Table 49. A driver shall comply with the specifications for each data rate/frequency for which operation of the driver is specified. Unless otherwise specified, these specifications are subject to the following conditions.

- The specifications apply over the supply voltage and ambient temperature ranges specified by the device vendor.
- The specifications apply for any combination of data patterns on the data signals.
- The output of a driver shall be connected to a 100 Ω, ±1%, differential (bridged) resistive load.
- Clock specifications apply only to clock signals.
- Data specifications apply only to data signals (FRAME, D[0:7]).

Table 47. RapidIO Driver AC Timing Specifications—500 Mbps Data Rate

Characteristic	Symbol	Range		Unit	Notes
		Min	Max		
Differential output high voltage	V_{OHD}	200	540	mV	1
Differential output low voltage	V_{OLD}	–540	–200	mV	1

Table 47. RapidIO Driver AC Timing Specifications—500 Mbps Data Rate (continued)

Characteristic	Symbol	Range		Unit	Notes
		Min	Max		
Duty cycle	DC	48	52	%	2, 6
V_{OD} rise time, 20%–80% of peak-to-peak differential signal swing	t_{FALL}	200	—	ps	3, 6
V_{OD} fall time, 20%–80% of peak-to-peak differential signal swing	t_{RISE}	200	—	ps	6
Data valid	DV	1260	—	ps	
Skew of any two data outputs	t_{DPAIR}	—	180	ps	4, 6
Skew of single data outputs to associated clock	$t_{SKEW,PAIR}$	–180	180	ps	5, 6

Notes:

1.See Figure 38.

2.Requires ±100 ppm long term frequency stability.

3.Measured at V_{OD} = 0 V.

4.Measured using the RapidIO transmit mask shown in Figure 38.

5.See Figure 43.

6.Guaranteed by design.

Table 48. RapidIO Driver AC Timing Specifications—750 Mbps Data Rate

Characteristic	Symbol	Range		Unit	Notes
		Min	Max		
Differential output high voltage	V_{OHD}	200	540	mV	1
Differential output low voltage	V_{OLD}	–540	–200	mV	1
Duty cycle	DC	48	52	%	2, 6
V_{OD} rise time, 20%–80% of peak-to-peak differential signal swing	t_{FALL}	133	—	ps	3, 6
V_{OD} fall time, 20%–80% of peak-to-peak differential signal swing	t_{RISE}	133	—	ps	6
Data valid	DV	800	—	ps	6
Skew of any two data outputs	t_{DPAIR}	—	133	ps	4, 6
Skew of single data outputs to associated clock	$t_{SKEW,PAIR}$	–133	133	ps	5, 6

Notes:

1.See Figure 38.

2.Requires ±100 ppm long term frequency stability.

3.Measured at V_{OD} = 0 V.

4.Measured using the RapidIO transmit mask shown in Figure 38.

5.See Figure 43.

6.Guaranteed by design.

Table 49. RapidIO Driver AC Timing Specifications—1 Gbps Data Rate

Characteristic	Symbol	Range		Unit	Notes
		Min	Max		
Differential output high voltage	V_{OHD}	200	540	mV	1
Differential output low voltage	V_{OLD}	–540	–200	mV	1
Duty cycle	DC	48	52	%	2, 6
V_{OD} rise time, 20%–80% of peak to peak differential signal swing	t_{FALL}	100	—	ps	3, 6
V_{OD} fall time, 20%–80% of peak to peak differential signal swing	t_{RISE}	100	—	ps	6
Data valid	DV	575	—	ps	6
Skew of any two data outputs	t_{DPAIR}	—	100	ps	4, 6
Skew of single data outputs to associated clock	$t_{SKEW,PAIR}$	–100	100	ps	5, 6

Notes:

1.See Figure 38.

2.Requires ±100 ppm long term frequency stability.

3.Measured at V_{OD} = 0 V.

4.Measured using the RapidIO transmit mask shown in Figure 38.

5.See Figure 43.

6.Guaranteed by design.

The compliance of driver output signals TD[0:15] and TFRAME with their minimum data valid window (DV) specification shall be determined by generating an eye pattern for each of the data signals and comparing the eye pattern of each data signal with the RapidIO transmit mask shown in Figure 38. The value of X2 used to construct the mask shall be $(1 – DV_{min})/2$. A signal is compliant with the data valid window specification if the transmit mask can be positioned on the signal's eye pattern such that the eye pattern falls entirely within the unshaded portion of the mask.

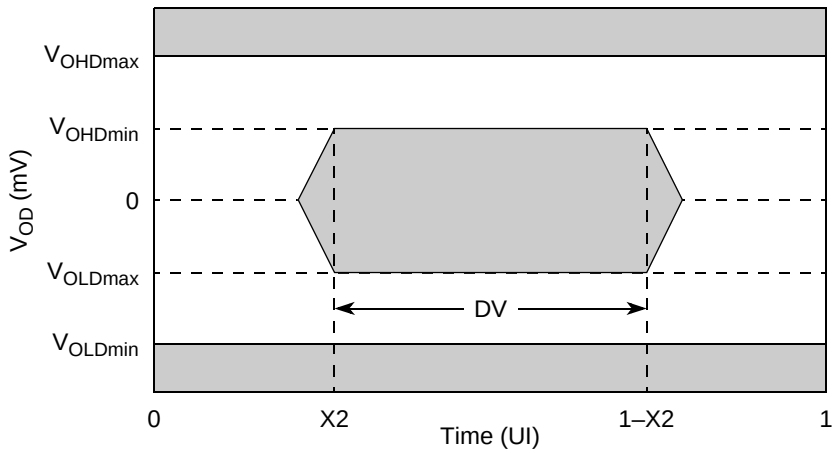

Figure 38. RapidIO Transmit Mask

The eye pattern for a data signal is generated by making a large number of recordings of the signal and then overlaying the recordings. The number of recordings used to generate the eye shall be large enough that further increasing the number of recordings used does not cause the resulting eye pattern to change from one that complies with the RapidIO transmit mask to one that does not. Each data signal in the interface shall be carrying random or pseudo-random data when the recordings are made. If pseudo-random data is used, the length of the pseudo-random sequence (repeat length) shall be long enough that increasing the length of the sequence does not cause the resulting eye pattern to change from one that complies with the RapidIO transmit mask to one that does not comply with the mask. The data carried by any given data signal in the interface may not be correlated with the data carried by any other data signal in the interface. The zero-crossings of the clock associated with a data signal shall be used as the timing reference for aligning the multiple recordings of the data signal when the recordings are overlaid.

While the method used to make the recordings and overlay them to form the eye pattern is not specified, the method used shall be demonstrably equivalent to the following method. The signal under test is repeatedly recorded with a digital oscilloscope in infinite persistence mode. Each recording is triggered by a zero-crossing of the clock associated with the data signal under test. Roughly half of the recordings are triggered by positive-going clock zero-crossings and roughly half are triggered by negative-going clock zero-crossings. Each recording is at least 1.9 UI in length (to ensure that at least one complete eye is formed) and begins 0.5 UI before the trigger point (0.5 UI before the associated clock zero-crossing). Depending on the length of the individual recordings used to generate the eye pattern, one or more complete eyes will be formed. Regardless of the number of eyes, the eye whose center is immediately to the right of the trigger point is the eye used for compliance testing.

An example of an eye pattern generated using the above method with recordings 3 UI in length is shown in Figure 39. In this example, there is no skew between the signal under test and the associated clock used to trigger the recordings. If skew was present, the eye pattern would be shifted to the left or right relative to the oscilloscope trigger point.

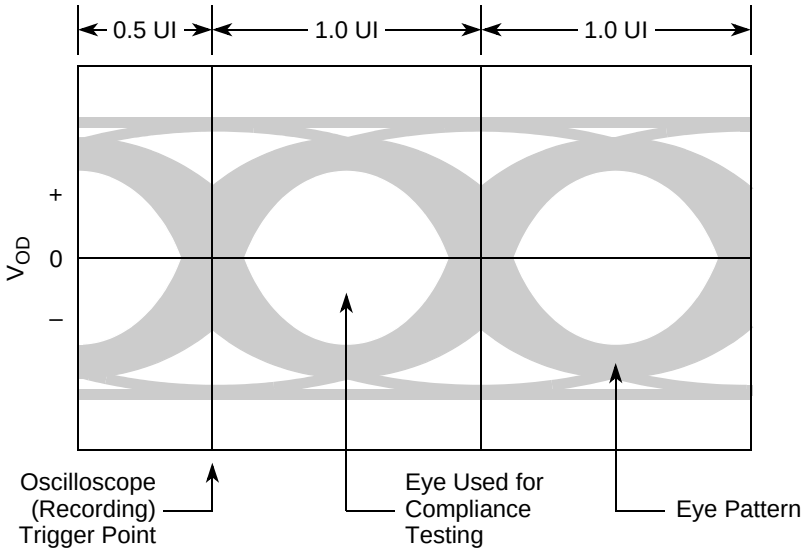

Figure 39. Example Driver Output Eye Pattern

13.3.2 RapidIO Receiver AC Timing Specifications

The RapidIO receiver AC timing specifications are provided in Table 50. A receiver shall comply with the specifications for each data rate/frequency for which operation of the receiver is specified. Unless otherwise specified, these specifications are subject to the following conditions.

- The specifications apply over the supply voltage and ambient temperature ranges specified by the device vendor.
- The specifications apply for any combination of data patterns on the data signals.
- The specifications apply over the receiver common mode and differential input voltage ranges.
- Clock specifications apply only to clock signals.
- Data specifications apply only to data signals (FRAME, D[0:7])

Table 50. RapidIO Receiver AC Timing Specifications—500 Mbps Data Rate

Characteristic	Symbol	Range		Unit	Notes
		Min	Max		
Duty cycle of the clock input	DC	47	53	%	1, 5
Data valid	DV	1080		ps	2
Allowable static skew between any two data inputs within a 8-/9-bit group	t_{DPAIR}	—	380	ps	3
Allowable static skew of data inputs to associated clock	$t_{SKEW,PAIR}$	–300	300	ps	4

Notes:
1.Measured at V_{ID} = 0 V.
2.Measured using the RapidIO receive mask shown in Figure 40.
3.See Figure 43.
4.See Figure 42 and Figure 43.
5.Guaranteed by design.

Table 51. RapidIO Receiver AC Timing Specifications—750 Mbps Data Rate

Characteristic	Symbol	Range		Unit	Notes
		Min	Max		
Duty cycle of the clock input	DC	47	53	%	1, 5
Data valid	DV	600	—	ps	2
Allowable static skew between any two data inputs within a 8-/9-bit group	t_{DPAIR}	—	400	ps	3
Allowable static skew of data inputs to associated clock	$t_{SKEW,PAIR}$	–267	267	ps	4

Notes:
1.Measured at V_{ID} = 0 V.
2.Measured using the RapidIO receive mask shown in Figure 40.
3.See Figure 43.
4.See Figure 42 and Figure 43.
5.Guaranteed by design.

Table 52. RapidIO Receiver AC Timing Specifications—1 Gbps Data Rate

Characteristic	Symbol	Range		Unit	Notes
		Min	Max		
Duty cycle of the clock input	DC	47	53	%	1, 5
Data valid	DV	425	—	ps	2
Allowable static skew between any two data inputs within a 8-/9-bit group	t_{DPAIR}	—	300	ps	3
Allowable static skew of data inputs to associated clock	$t_{SKEW,PAIR}$	–200	200	ps	4

Notes:
1.Measured at V_{ID} = 0 V.
2.Measured using the RapidIO receive mask shown in Figure 40.
3.See Figure 43.
4.See Figure 42 and Figure 43.
5.Guaranteed by design.

The compliance of receiver input signals RD[0:15] and RFRAME with their minimum data valid window (DV) specification shall be determined by generating an eye pattern for each of the data signals and comparing the eye pattern of each data signal with the RapidIO receive mask shown in Figure 40. The value of X2 used to construct the mask shall be $(1 – DV_{min})/2$. The ±100 mV minimum data valid and ±600 mV maximum input voltage values are from the DC specification. A signal is compliant with the data valid window specification if and only if the receive mask can be positioned on the signal's eye pattern such that the eye pattern falls entirely within the unshaded portion of the mask.

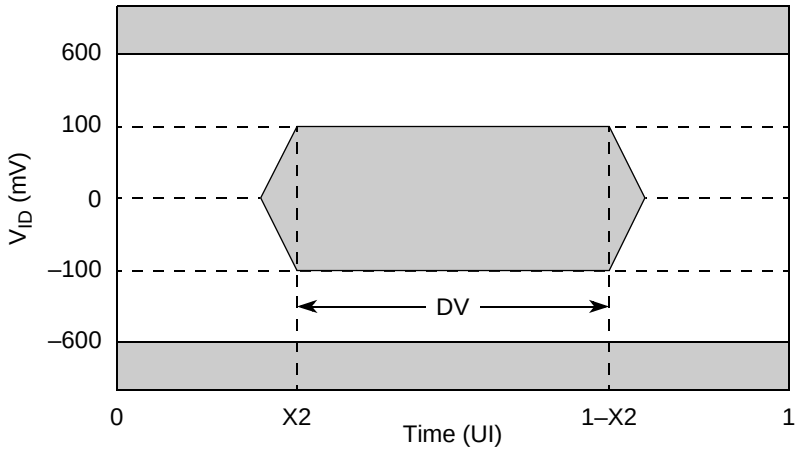

Figure 40. RapidIO Receive Mask

The eye pattern for a data signal is generated by making a large number of recordings of the signal and then overlaying the recordings. The number of recordings used to generate the eye shall be large enough that further increasing the number of recordings used does not cause the resulting eye pattern to change from one that complies with the RapidIO receive mask to one that does not. Each data signal in the interface shall be carrying random or pseudo-random data when the recordings are made. If pseudo-random data is used, the length of the pseudo-random sequence (repeat length) shall be long

enough that increasing the length of the sequence does not cause the resulting eye pattern to change from one that complies with the RapidIO receive mask to one that does not comply with the mask. The data carried by any given data signal in the interface may not be correlated with the data carried by any other data signal in the interface. The zero-crossings of the clock associated with a data signal shall be used as the timing reference for aligning the multiple recordings of the data signal when the recordings are overlaid.

While the method used to make the recordings and overlay them to form the eye pattern is not specified, the method used shall be demonstrably equivalent to the following method. The signal under test is repeatedly recorded with a digital oscilloscope in infinite persistence mode. Each recording is triggered by a zero-crossing of the clock associated with the data signal under test. Roughly half of the recordings are triggered by positive-going clock zero-crossings and roughly half are triggered by negative-going clock zero-crossings. Each recording is at least 1.9 UI in length (to ensure that at least one complete eye is formed) and begins 0.5 UI before the trigger point (0.5 UI before the associated clock zero-crossing). Depending on the length of the individual recordings used to generate the eye pattern, one or more complete eyes will be formed. Regardless of the number of eyes, the eye whose center is immediately to the right of the trigger point is the eye used for compliance testing.

An example of an eye pattern generated using the above method with recordings 3 UI in length is shown in Figure 41. In this example, there is no skew between the signal under test and the associated clock used to trigger the recordings. If skew was present, the eye pattern would be shifted to the left or right relative to the oscilloscope trigger point.

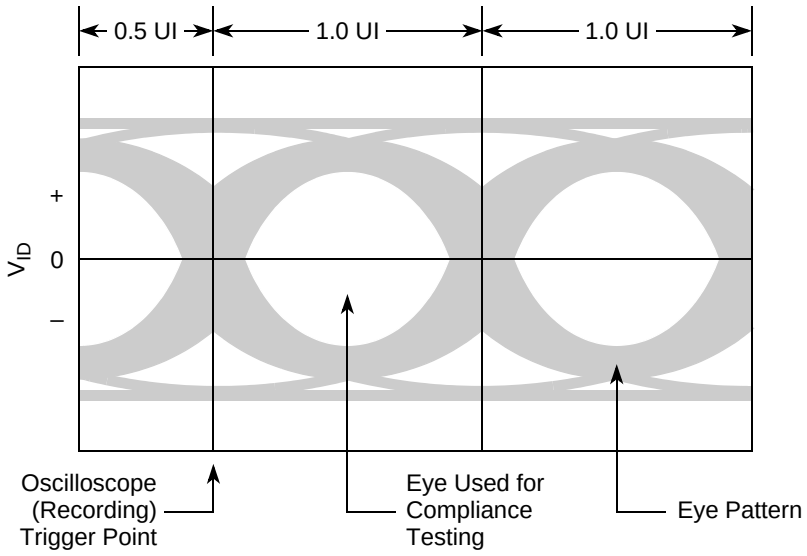

Figure 41. Example Receiver Input Eye Pattern

Figure 42 shows the definitions of the data to clock static skew parameter $t_{SKEW,PAIR}$ and the data valid window parameter DV. The data and frame bits are those that are associated with the clock. The figure applies for all zero-crossings of the clock. All of the signals are differential signals. V_D represents V_{OD} for the transmitter and V_{ID} for the receiver. The center of the eye is defined as the midpoint of the region in which the magnitude of the signal voltage is greater than or equal to the minimum DV voltage.

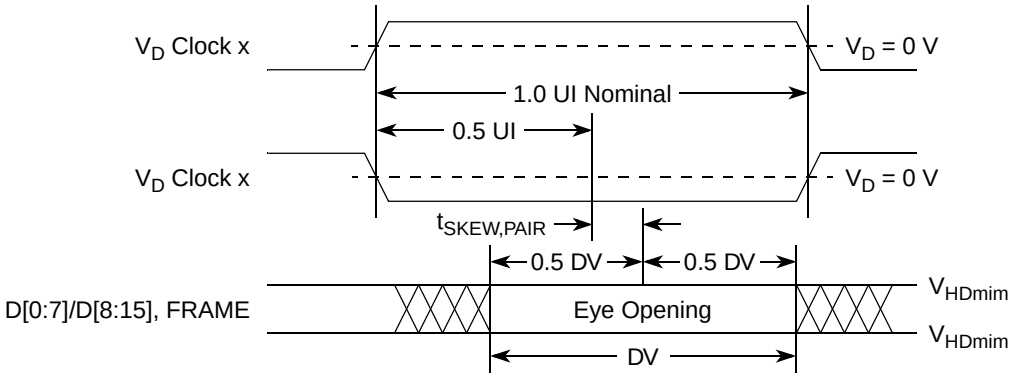

Figure 42. Data to Clock Skew

Figure 43 shows the definition of the data to data static skew parameter t_{DPAIR} and how the skew parameters are applied.

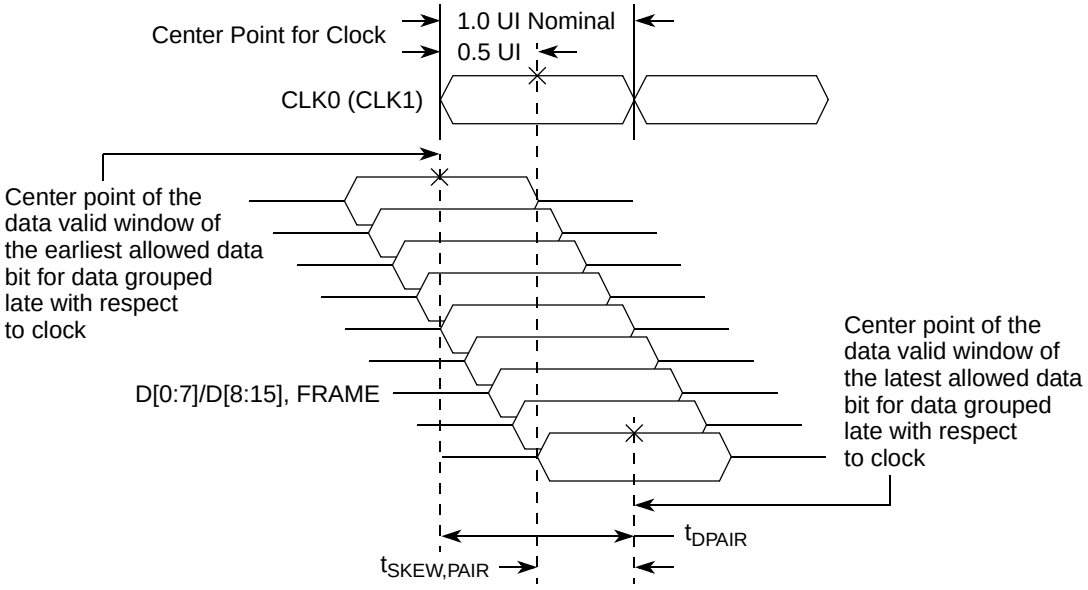

Figure 43. Static Skew Diagram

14 Package and Pin Listings

This section details package parameters, pin assignments, and dimensions.

14.1 Package Parameters for the MPC8540 FC-PBGA

The package parameters are as provided in the following list. The package type is 29 mm × 29 mm, 783 flip chip plastic ball grid array (FC-PBGA).

Die size	12.2 mm × 9.5 mm
Package outline	29 mm × 29 mm
Interconnects	783
Pitch	1 mm
Minimum module height	3.07 mm
Maximum module height	3.75 mm
Solder Balls	62 Sn/36 Pb/2 Ag
Ball diameter (typical)	0.5 mm

14.2 Mechanical Dimensions of the MPC8540 FC-PBGA

Figure 44 the mechanical dimensions and bottom surface nomenclature of the MPC8540, 783 FC-PBGA package.

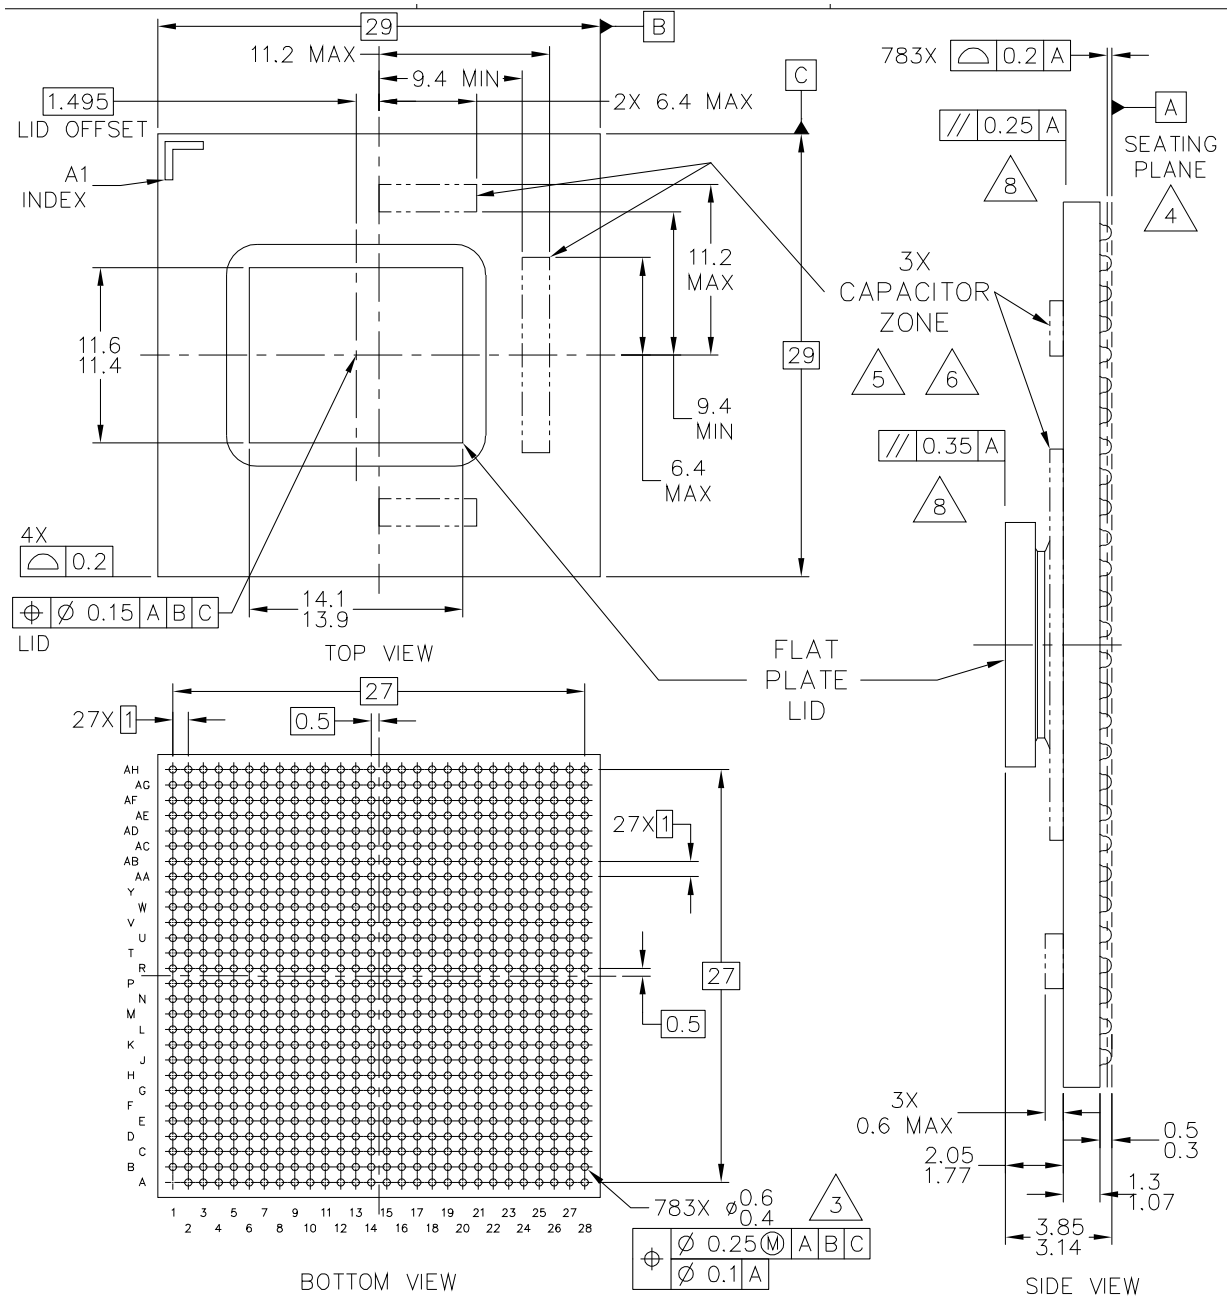

Figure 44. Mechanical Dimensions and Bottom Surface Nomenclature of the MPC8540 FC-PBGA

NOTES

1. All dimensions are in millimeters.
2. Dimensions and tolerances per ASME Y14.5M-1994.

3. Maximum solder ball diameter measured parallel to datum A.
4. Datum A, the seating plane, is defined by the spherical crowns of the solder balls.
5. Capacitors may not be present on all devices.
6. Caution must be taken not to short capacitors or exposed metal capacitor pads on package top.
7. The socket lid must always be oriented to A1.

14.3 Pinout Listings

Table 53 provides the pin-out listing for the MPC8540, 783 FC-PBGA package.

Notes:

1. All multiplexed signals are listed only once and do not re-occur. For example, $\overline{\text{LCS5}}$/$\overline{\text{DMA\_REQ2}}$ is listed only once in the Local Bus Controller Interface section, and is not mentioned in the DMA section even though the pin also functions as $\overline{\text{DMA\_REQ2}}$.
2. Recommend a weak pull-up resistor (2–10 kΩ) be placed on this pin to OV_{DD}.
3. This pin must always be tied to GND. .
4. This pin is an open drain signal.
5. This pin is a reset configuration pin. It has a weak internal pull-up P-FET which is enabled only when the MPC8540 is in the reset state. This pull-up is designed such that it can be overpowered by an external 4.7-kΩ pull-down resistor. If an external device connected to this pin might pull it down during reset, then a pull-up or active driver is needed if the signal is intended to be high during reset.
6. Treat these pins as no connects (NC) unless using debug address functionality.
7. The value of LA[28:31] during reset sets the CCB clock to SYSCLK PLL ratio. These pins require 4.7-kΩ pull-up or pull-down resistors. See Section 15.2, "Platform/System PLL Ratio."
8. The value of LALE and LGPL2 at reset set the e500 core clock to CCB Clock PLL ratio. These pins require 4.7-kΩ pull-up or pull-down resistors. See the Section 15.3, "e500 Core PLL Ratio."
9. Functionally, this pin is an output, but structurally it is an I/O because it either samples configuration input during reset or because it has other manufacturing test functions. This pin will therefore be described as an I/O for boundary scan.
10. This pin functionally requires a pull-up resistor, but during reset it is a configuration input that controls 32- vs. 64-bit PCI operation. Therefore, it must be actively driven low during reset by reset logic if the device is to be configured to be a 64-bit PCI device. Refer to the *PCI Specification*.
11. This output is actively driven during reset rather than being three-stated during reset.
12. These JTAG pins have weak internal pull-up P-FETs that are always enabled.
13. These pins are connected to the V_{DD}/GND planes internally and may be used by the core power supply to improve tracking and regulation.
14. Internal thermally sensitive resistor.
15. No connections should be made to these pins.
16. These pins are not connected for any functional use.
17. PCI specifications recommend that a weak pull-up resistor (2–10 kΩ) be placed on the higher order pins to OV_{DD} when using 64-bit buffer mode (pins PCI_AD[63:32] and PCI_C_BE[7:4]).
18. Note that these signals are POR configurations for Rev. 1.x and notes 5 and 9 apply to these signals in Rev. 1.x but not in later revisions.
19 If this pin is connected to a device that pulls down during reset, an external pull-up is required to drive this pin to a logic –1 state during reset.
20. Recommend a pull-up resistor (~1 KΩ) b placed on this pin to OV_{DD}.
21. These are test signals for factory use only and must be pulled up (100 Ω - 1 kΩ) to OVDD for normal machine operation.
22. If this signal is used as both an input and an output, a weak pull-up (~10 kΩ) is required on this pin.

15 Clocking

This section describes the PLL configuration of the MPC8540. Note that the platform clock is identical to the CCB clock.

15.1 Clock Ranges

Table 54 provides the clocking specifications for the processor core and Table 55 provides the clocking specifications for the memory bus.

Table 54. Processor Core Clocking Specifications

Characteristic	Maximum Processor Core Frequency						Unit	Notes
	667 MHz		833 MHz		1 GHz			
	Min	Max	Min	Max	Min	Max		
e500 core processor frequency	400	667	400	833	400	1000	MHz	1, 2, 3

Notes:

1. **Caution:** The CCB to SYSCLK ratio and e500 core to CCB ratio settings must be chosen such that the resulting SYSCLK frequency, e500 (core) frequency, and CCB frequency do not exceed their respective maximum or minimum operating frequencies. Refer to Section 15.2, “Platform/System PLL Ratio,” and Section 15.3, “e500 Core PLL Ratio,” for ratio settings.
2.)The minimum e500 core frequency is based on the minimum platform frequency of 200 MHz.
3.)The 1.0 GHz core frequency is based on a 1.3 V VDD supply voltage.

Table 55. Memory Bus Clocking Specifications

Characteristic	Maximum Processor Core Frequency						Unit	Notes
	667 MHz		833 MHz		1 GHz			
	Min	Max	Min	Max	Min	Max		
Memory bus frequency	100	166	100	166	100	166	MHz	1, 2, 3

Notes:

1. **Caution:** The CCB to SYSCLK ratio and e500 core to CCB ratio settings must be chosen such that the resulting SYSCLK frequency, e500 (core) frequency, and CCB frequency do not exceed their respective maximum or minimum operating frequencies. Refer to Section 15.2, “Platform/System PLL Ratio,” and Section 15.3, “e500 Core PLL Ratio,” for ratio settings.
2. The memory bus speed is half of the DDR data rate, hence, half of the platform clock frequency.
3.)The 1.0 GHz core frequency is based on a 1.3 V VDD supply voltage.

15.2 Platform/System PLL Ratio

The platform clock is the clock that drives the L2 cache, the DDR SDRAM data rate, and the e500 core complex bus (CCB), and is also called the CCB clock. The values are determined by the binary value on LA[28:31] at power up, as shown in Table 56.

There is no default for this PLL ratio; these signals must be pulled to the desired values.

Table 56. CCB Clock Ratio

Binary Value of LA[28:31] Signals	Ratio Description
0000	16:1 ratio CCB clock: SYSCLK (PCI bus)
0001	Reserved
0010	2:1 ratio CCB clock: SYSCLK (PCI bus)
0011	3:1 ratio CCB clock: SYSCLK (PCI bus)
0100	4:1 ratio CCB clock: SYSCLK (PCI bus)
0101	5:1 ratio CCB clock: SYSCLK (PCI bus)
0110	6:1 ratio CCB clock: SYSCLK (PCI bus)
0111	Reserved
1000	8:1 ratio CCB clock: SYSCLK (PCI bus)
1001	9:1 ratio CCB clock: SYSCLK (PCI bus)
1010	10:1 ratio CCB clock: SYSCLK (PCI bus)
1011	Reserved
1100	12:1 ratio CCB clock: SYSCLK (PCI bus)
1101	Reserved
1110	Reserved
1111	Reserved

15.3 e500 Core PLL Ratio

Table 57 describes the clock ratio between the e500 core complex bus (CCB) and the e500 core clock. This ratio is determined by the binary value of LALE and LGPL2 at power up, as shown in Table 57.

Table 57. e500 Core to CCB Ratio

Binary Value of LALE, LGPL2 Signals	Ratio Description
00	2:1 e500 core:CCB
01	5:2 e500 core:CCB
10	3:1 e500 core:CCB
11	7:2 e500 core:CCB

15.4 Frequency Options

Table 58 shows the expected frequency values for the platform frequency when using a CCB to SYSCLK ratio in comparison to the memory bus speed.

Table 58. Frequency Options with Respect to Memory Bus Speeds

CCB to SYSCLK Ratio	SYSCLK (MHz)								
	16.67	25	33.33	41.63	66.67	83	100	111	133.33
	Platform/CCB Frequency (MHz)								
2							200	222	267
3					200	250	300	333	
4					267	333			
5				208	333				
6			200	250					
8		200	267	333					
9		225	300						
10		250	333						
12	200	300							
16	267								

16 Thermal

This section describes the thermal specifications of the MPC8540.

16.1 Thermal Characteristics

Table 59 provides the package thermal characteristics for the MPC8540.

Table 59. Package Thermal Characteristics

Characteristic	Symbol	Value	Unit	Notes
Junction-to-ambient Natural Convection on four layer board (2s2p)	$R_{\theta JMA}$	16	°C/W	1, 2
Junction-to-ambient (@100 ft/min or 0.5 m/s) on four layer board (2s2p)	$R_{\theta JMA}$	14	°C/W	1, 2
Junction-to-ambient (@200 ft/min or 1 m/s) on four layer board (2s2p)	$R_{\theta JMA}$	12	•C/W	1, 2
Junction-to-board thermal	$R_{\theta JB}$	7.5	•C/W	3

Table 59. Package Thermal Characteristics (continued)

Characteristic	Symbol	Value	Unit	Notes
Junction-to-case thermal	$R_{\theta JC}$	0.8	•C/W	4

Notes

1. Junction temperature is a function of die size, on-chip power dissipation, package thermal resistance, mounting site (board) temperature, ambient temperature, air flow, power dissipation of other components on the board, and board thermal resistance
2. Per JEDEC JESD51-6 with the board horizontal.
3. Thermal resistance between the die and the printed-circuit board per JEDEC JESD51-8. Board temperature is measured on the top surface of the board near the package.
4. Thermal resistance between the die and the case top surface as measured by the cold plate method (MIL SPEC-883 Method 1012.1). Cold plate temperature is used for case temperature; measured value includes the thermal resistance of the interface layer.

16.2 Thermal Management Information

This section provides thermal management information for the flip chip plastic ball grid array (FC-PBGA) package for air-cooled applications. Proper thermal control design is primarily dependent on the system-level design—the heat sink, airflow, and thermal interface material. The recommended attachment method to the heat sink is illustrated in Figure 45. The heat sink should be attached to the printed-circuit board with the spring force centered over the die. This spring force should not exceed 10 pounds force.

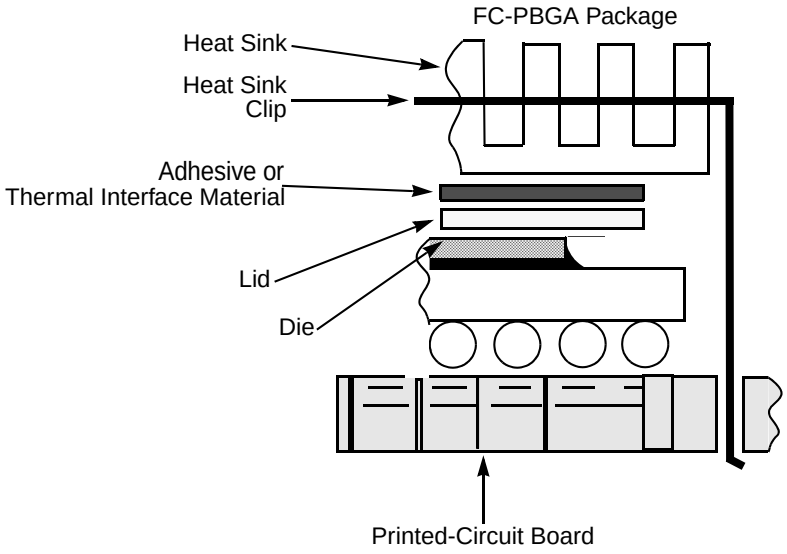

Figure 45. Package Exploded Cross-Sectional View with Several Heat Sink Options

The system board designer can choose between several types of heat sinks to place on the MPC8540. There are several commercially-available heat sinks from the following vendors:

Aavid Thermalloy 603-224-9988
80 Commercial St.
Concord, NH 03301
Internet: www.aavidthermalloy.com

Alpha Novatech 473 Sapena Ct. #15 Santa Clara, CA 95054 Internet: www.alphanovatech.com	408-749-7601
International Electronic Research Corporation (IERC) 413 North Moss St. Burbank, CA 91502 Internet: www.ctscorp.com	818-842-7277
Millennium Electronics (MEI) Loroco Sites 671 East Brokaw Road San Jose, CA 95112 Internet: www.mei-millennium.com	408-436-8770
Tyco Electronics Chip Coolers™ P.O. Box 3668 Harrisburg, PA 17105-3668 Internet: www.chipcoolers.com	800-522-6752
Wakefield Engineering 33 Bridge St. Pelham, NH 03076 Internet: www.wakefield.com	603-635-5102

Ultimately, the final selection of an appropriate heat sink depends on many factors, such as thermal performance at a given air velocity, spatial volume, mass, attachment method, assembly, and cost. Several heat sinks offered by Aavid Thermalloy, Alpha Novatech, IERC, Chip Coolers, Millennium Electronics, and Wakefield Engineering offer different heat sink-to-ambient thermal resistances, that will allow the MPC8540 to function in various environments.

16.2.1 Recommended Thermal Model

For system thermal modeling, the MPC8540 thermal model is shown in Figure 46. Five cuboids are used to represent this device. To simplify the model, the solder balls and substrate are modeled as a single block 29x29x1.47 mm with the conductivity adjusted accordingly. For modeling, the planar dimensions of the die are rounded to the nearest mm, so the die is modeled as 10x12 mm at a thickness of 0.76 mm. The bump/underfill layer is modeled as a collapsed resistance between the die and substrate assuming a conductivity of 0.6 in-plane and 1.9 W/m•K in the thickness dimension of 0.76 mm. The lid attach adhesive is also modeled as a collapsed resistance with dimensions of 10x12x0.050 mm and the conductivity of 1 W/m•K. The nickel plated copper lid is modeled as 12x14x1 mm. Note that the die and lid are not centered on the substrate; there is a 1.5 mm offset documented in the case outline drawing in Figure 44.

Conductivity	Value	Unit
Lid (12 × 14 × 1 mm)		
k_x	360	W/(m × K)
k_y	360	
k_z	360	
Lid Adhesive—Collapsed resistance (10 × 12 × 0.050 mm)		
k_x	1	
k_y	1	
k_z	1	
Die (10 × 12 × 0.76 mm)		
Bump/Underfill—Collapsed resistance (10 × 12 × 0.070 mm)		
k_x	0.6	
k_y	0.6	
k_z	1.9	
Substrate and Solder Balls (29 × 29 × 1.47 mm)		
k_x	10.2	
k_y	10.2	
k_z	1.6	

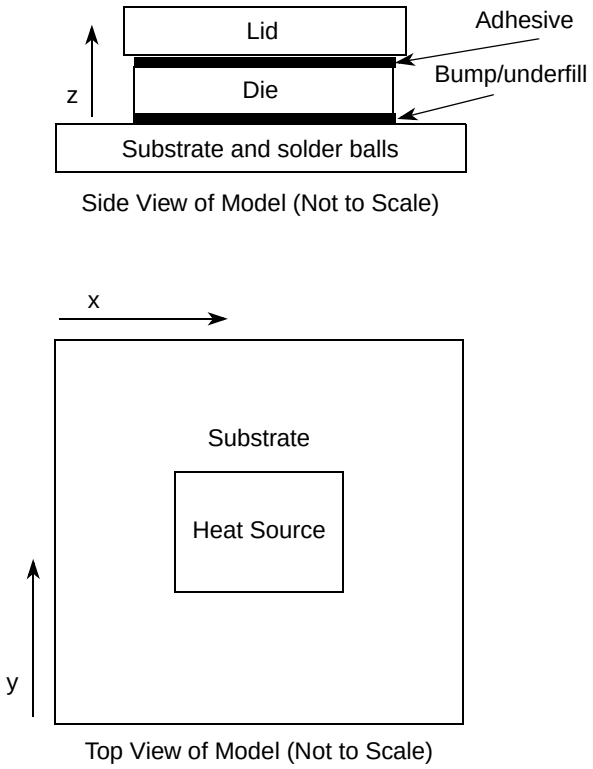

Figure 46. MPC8540 Thermal Model

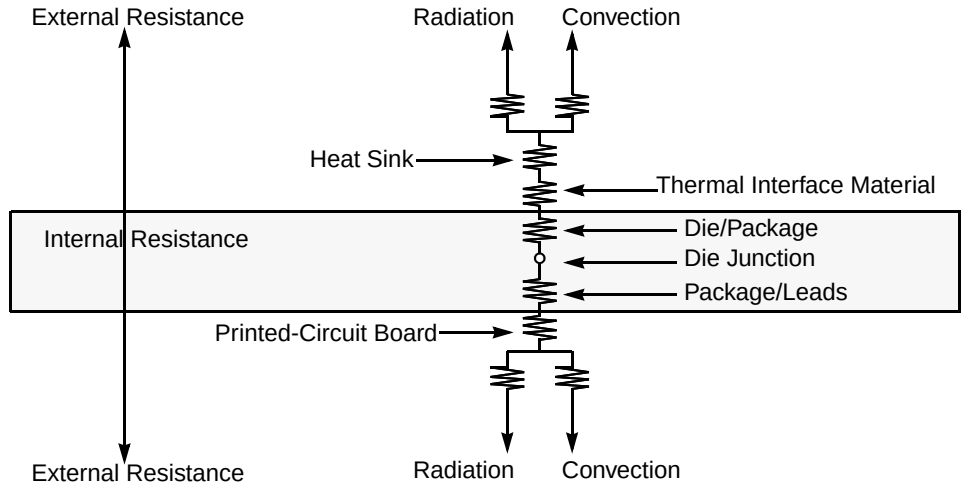
16.2.2 Internal Package Conduction Resistance

For the packaging technology, shown in Table 59, the intrinsic internal conduction thermal resistance paths are as follows:

- The die junction-to-case thermal resistance
- The die junction-to-board thermal resistance

Figure 47 depicts the primary heat transfer path for a package with an attached heat sink mounted to a printed-circuit board.



(Note the internal versus external package resistance)

Figure 47. Package with Heat Sink Mounted to a Printed-Circuit Board

The heat sink removes most of the heat from the device. Heat generated on the active side of the chip is conducted through the silicon and through the lid, then through the heat sink attach material (or thermal interface material), and finally to the heat sink. The junction-to-case thermal resistance is low enough that the heat sink attach material and heat sink thermal resistance are the dominant terms.

16.2.3 Thermal Interface Materials

A thermal interface material is required at the package-to-heat sink interface to minimize the thermal contact resistance. For those applications where the heat sink is attached by spring clip mechanism, Figure 48 shows the thermal performance of three thin-sheet thermal-interface materials (silicone, graphite/oil, floroether oil), a bare joint, and a joint with thermal grease as a function of contact pressure. As shown, the performance of these thermal interface materials improves with increasing contact pressure. The use of thermal grease significantly reduces the interface thermal resistance. The bare joint results in a thermal resistance approximately six times greater than the thermal grease joint.

Heat sinks are attached to the package by means of a spring clip to holes in the printed-circuit board (see Figure 45). Therefore, the synthetic grease offers the best thermal performance, especially at the low interface pressure.

When removing the heat sink for re-work, it is preferable to slide the heat sink off slowly until the thermal interface material loses its grip. If the support fixture around the package prevents sliding off the heat sink, the heat sink should be slowly removed. Heating the heat sink to 40-50•C with an air gun can soften the interface material and make the removal easier. The use of an adhesive for heat sink attach is not recommended.

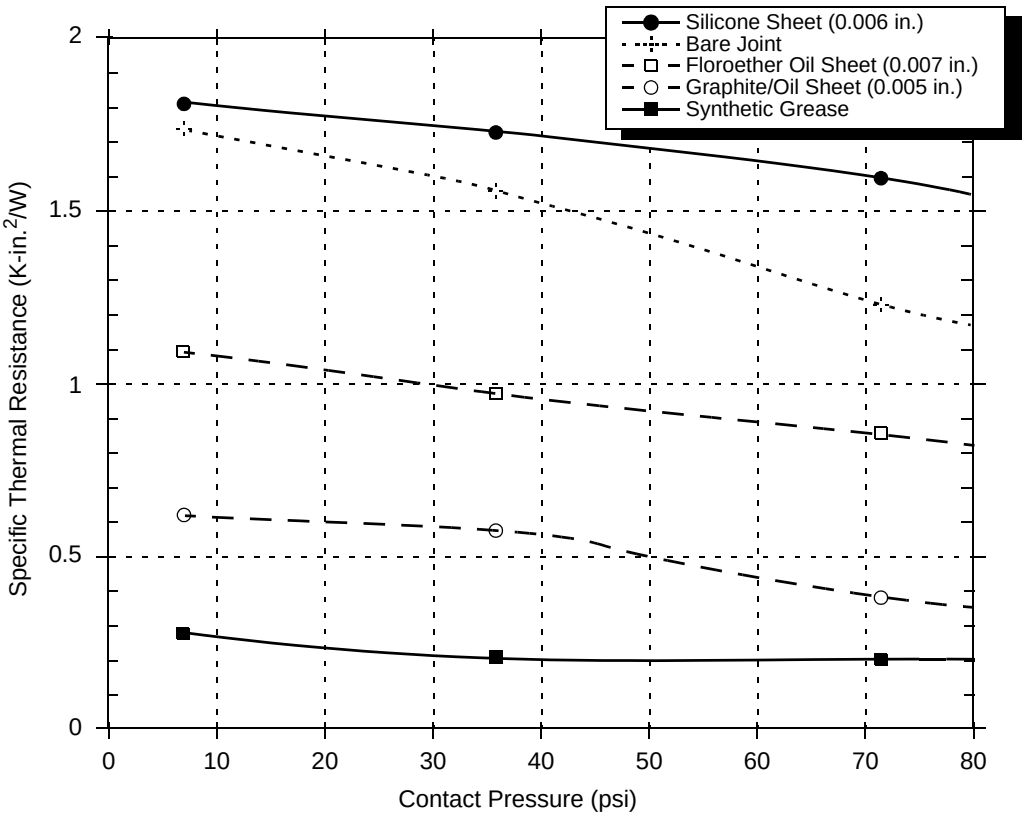


Figure 48. Thermal Performance of Select Thermal Interface Materials

The system board designer can choose between several types of thermal interface. There are several commercially-available thermal interfaces provided by the following vendors:

Chomerics, Inc. 77 Dragon Ct. Woburn, MA 01888-4014 Internet: www.chomerics.com	781-935-4850
Dow-Corning Corporation Dow-Corning Electronic Materials 2200 W. Salzburg Rd. Midland, MI 48686-0997 Internet: www.dowcorning.com	800-248-2481

4707 Detroit Ave.
Cleveland, OH 44102
Internet: www.thermagon.com

16.2.4 Heat Sink Selection Examples

The following section provides a heat sink selection example using one of the commercially available heat sinks.

16.2.4.1 Case 1

For preliminary heat sink sizing, the die-junction temperature can be expressed as follows:

$$T_J = T_I + T_R + (\theta_{JC} + \theta_{INT} + \theta_{SA}) \times P_D$$

where

T_J is the die-junction temperature

T_I is the inlet cabinet ambient temperature

T_R is the air temperature rise within the computer cabinet

θ_{JC} is the junction-to-case thermal resistance

θ_{INT} is the adhesive or interface material thermal resistance

θ_{SA} is the heat sink base-to-ambient thermal resistance

P_D is the power dissipated by the device

During operation the die-junction temperatures (T_J) should be maintained within the range specified in Table 2. The temperature of air cooling the component greatly depends on the ambient inlet air temperature and the air temperature rise within the electronic cabinet. An electronic cabinet inlet-air temperature (T_A) may range from 30° to 40°C. The air temperature rise within a cabinet (T_R) may be in the range of 5° to 10°C. The thermal resistance of some thermal interface material (θ_{INT}) may be about 1°C/W. Assuming a T_I of 30 C, a T_R of 5 C, a FC-PBGA package θ_{JC} = 0.8, and a power consumption (P_D) of 7.0 W, the following expression for T_J is obtained:

$$\text{Die-junction temperature: } T_J = 30°C + 5°C + (0.8°C/W + 1.0°C/W + \theta_{SA}) \times 7.0\ W$$

The heat sink-to-ambient thermal resistance (θ_{SA}) versus airflow velocity for a Thermalloy heat sink #2328B is shown in Figure 49.

Assuming an air velocity of 2 m/s, we have an effective θ_{SA+} of about 3.3 C/W, thus

$$T_J = 30\ C + 5\ C + (0.8\ C/W + 1.0\ C/W + 3.3\ C/W) \times 7.0\ W,$$

resulting in a die-junction temperature of approximately 71 C which is well within the maximum operating temperature of the component.

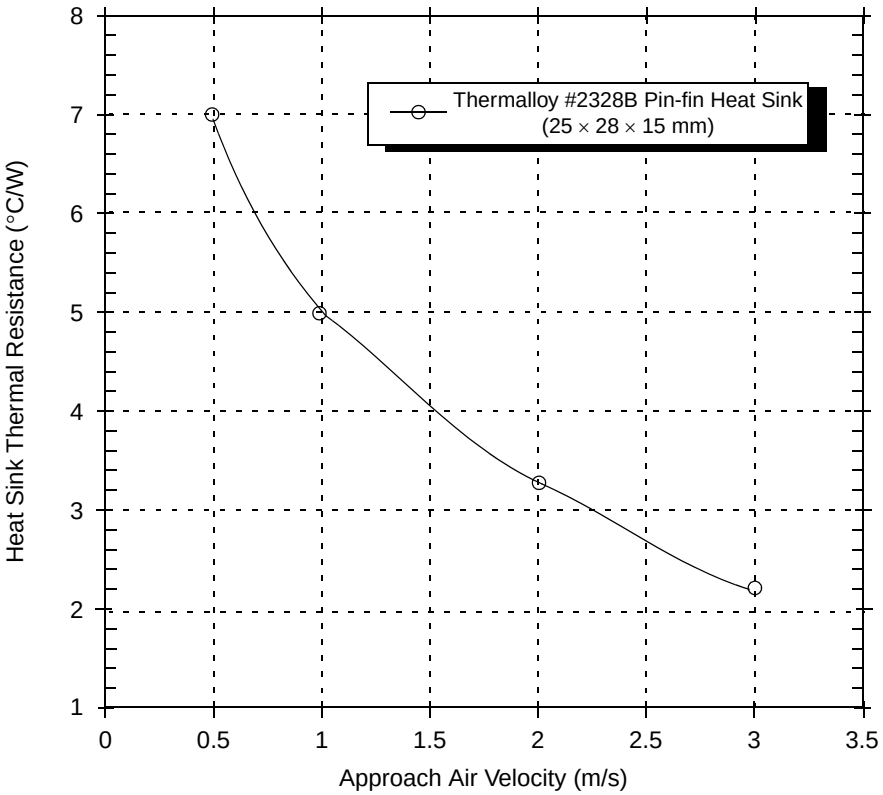

Figure 49. Thermalloy #2328B Heat Sink-to-Ambient Thermal Resistance Versus Airflow Velocity

16.2.4.2 Case 2

Every system application has different conditions that the thermal management solution must solve. As an alternate example, assume that the air reaching the component is 85 C with an approach velocity of 1 m/sec. For a maximum junction temperature of 105 C at 7 W, the total thermal resistance of junction to case thermal resistance plus thermal interface material plus heat sink thermal resistance must be less than 2.8 C/W. The value of the junction to case thermal resistance in Table 59 includes the thermal interface resistance of a thin layer of thermal grease as documented in footnote 4 of the table. Assuming that the heat sink is flat enough to allow a thin layer of grease or phase change material, then the heat sink must be less than 2 C/W.

Millennium Electronics (MEI) has tooled a heat sink MTHERM-1051 for this requirement assuming a compactPCI environment at 1 m/sec and a heat sink height of 12 mm. The MEI solution is illustrated in Figure 50 and Figure 51. This design has several significant advantages:

- The heat sink is clipped to a plastic frame attached to the application board with screws or plastic inserts at the corners away from the primary signal routing areas.
- The heat sink clip is designed to apply the force holding the heat sink in place directly above the die at a maximum force of less than 10 lbs.
- For applications with significant vibration requirements, silicone damping material can be applied between the heat sink and plastic frame.

The spring mounting should be designed to apply the force only directly above the die. By localizing the force, rocking of the heat sink is minimized. One suggested mounting method attaches a plastic fence to the board to provide the structure on which the heat sink spring clips. The plastic fence also provides the opportunity to minimize the holes in the printed-circuit board and to locate them at the corners of the package. Figure 50 and Figure 51 provide exploded views of the plastic fence, heat sink, and spring clip.

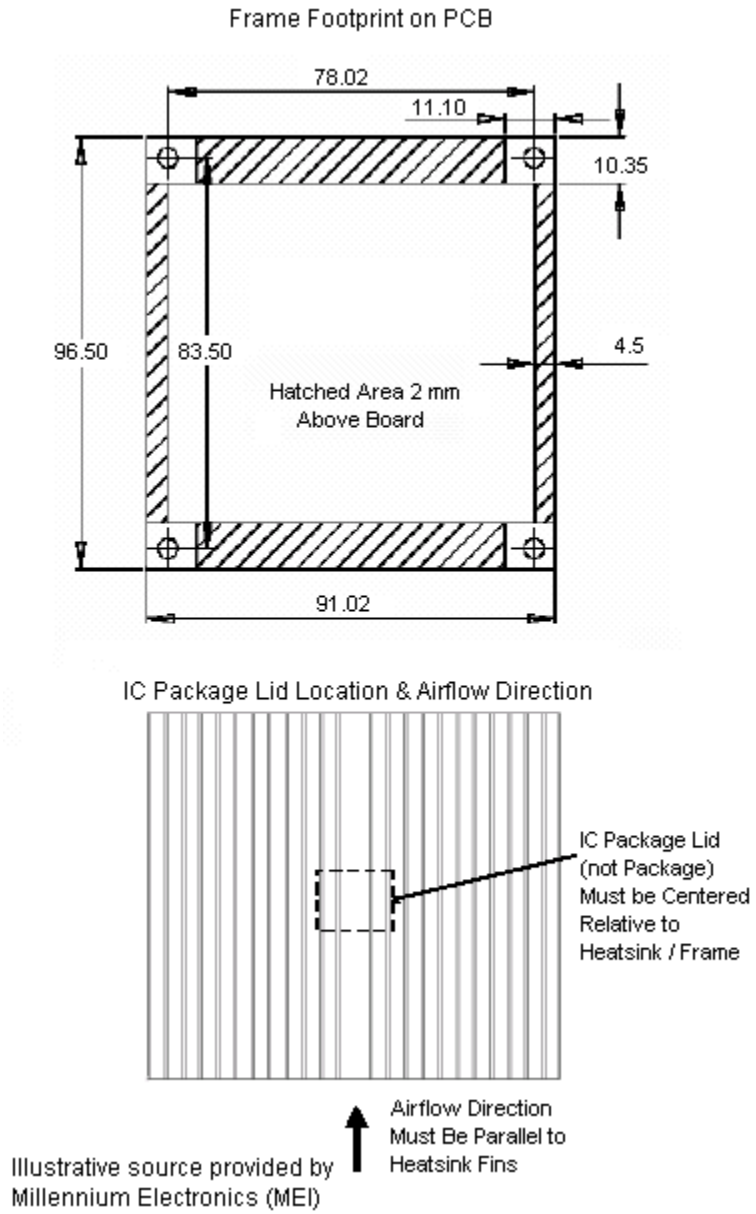

Figure 50. Exploded Views (1) of a Heat Sink Attachment using a Plastic Force

Item No	QTY	MEI PN	Description

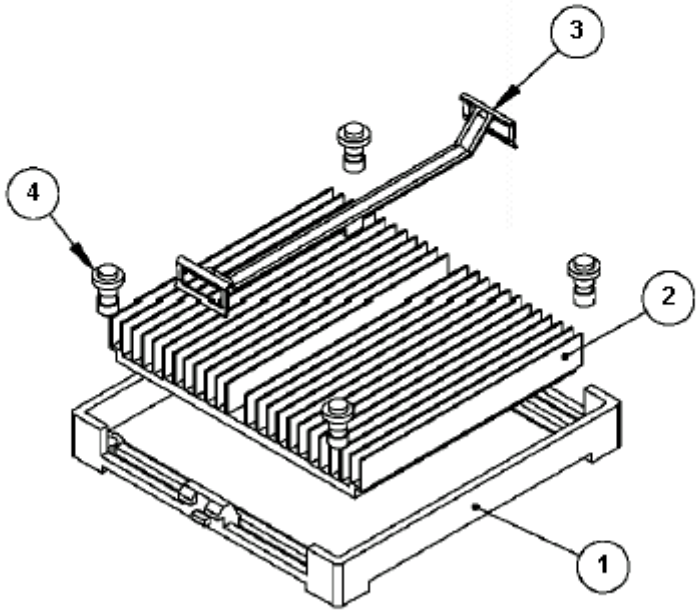
4	4	MPPINS-1000	FRAME ATTACHMENT PINS



Illustrative source provided by
Millennium Electronics (MEI)

Figure 51. Exploded Views (2) of a Heat Sink Attachment using a Plastic Fence

The die junction-to-ambient and the heat sink-to-ambient thermal resistances are common figure-of-merits used for comparing the thermal performance of various microelectronic packaging technologies, one should exercise caution when only using this metric in determining thermal management because no single parameter can adequately describe three-dimensional heat flow. The final die-junction operating temperature is not only a function of the component-level thermal resistance, but the system level design and its operating conditions. In addition to the component's power consumption, a number of factors affect the final operating die-junction temperature: airflow, board population (local heat flux of adjacent components), system air temperature rise, altitude, etc.

Due to the complexity and the many variations of system-level boundary conditions for today's microelectronic equipment, the combined effects of the heat transfer mechanisms (radiation convection and conduction) may vary widely. For these reasons, we recommend using conjugate heat transfer models for the boards, as well as, system-level designs.

17 System Design Information

This section provides electrical and thermal design recommendations for successful application of the MPC8540.

17.1 System Clocking

The MPC8540includes two PLLs.

1. The platform PLL generates the platform clock from the externally supplied SYSCLK input. The frequency ratio between the platform and SYSCLK is selected using the platform PLL ratio configuration bits as described in Section 15.2, “Platform/System PLL Ratio.”
2. The e500 Core PLL generates the core clock as a slave to the platform clock. The frequency ratio between the e500 core clock and the platform clock is selected using the e500 PLL ratio configuration bits as described in Section 15.3, “e500 Core PLL Ratio.”

17.2 PLL Power Supply Filtering

Each of the PLLs listed above is provided with power through independent power supply pins ($AV_{DD}1$ and $AV_{DD}2$, respectively). The AV_{DD} level should always be equivalent to V_{DD}, and preferably these voltages will be derived directly from V_{DD} through a low frequency filter scheme such as the following.

There are a number of ways to reliably provide power to the PLLs, but the recommended solution is to provide three independent filter circuits as illustrated in Figure 52, one to each of the three AV_{DD} pins. By providing independent filters to each PLL the opportunity to cause noise injection from one PLL to the other is reduced.

This circuit is intended to filter noise in the PLLs resonant frequency range from a 500 kHz to 10 MHz range. It should be built with surface mount capacitors with minimum Effective Series Inductance (ESL). Consistent with the recommendations of Dr. Howard Johnson in *High Speed Digital Design: A Handbook of Black Magic* (Prentice Hall, 1993), multiple small capacitors of equal value are recommended over a single large value capacitor.

Each circuit should be placed as close as possible to the specific AV_{DD} pin being supplied to minimize noise coupled from nearby circuits. It should be possible to route directly from the capacitors to the AV_{DD} pin, which is on the periphery of the 783 FC-PBGA footprint, without the inductance of vias.

Figure 52 shows the PLL power supply filter circuit.

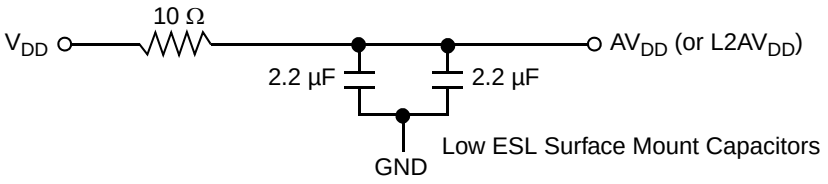


Figure 52. PLL Power Supply Filter Circuit

17.3 Decoupling Recommendations

Due to large address and data buses, and high operating frequencies, the MPC8540 can generate transient power surges and high frequency noise in its power supply, especially while driving large capacitive loads. This noise must be prevented from reaching other components in the MPC8540 system, and the MPC8540 itself requires a clean, tightly regulated source of power. Therefore, it is recommended that the system designer place at least one decoupling capacitor at each V_{DD}, OV_{DD}, GV_{DD}, and LV_{DD} pins of the MPC8540. These decoupling capacitors should receive their power from separate V_{DD}, OV_{DD}, GV_{DD}, LV_{DD}, and GND power planes in the PCB, utilizing short traces to minimize inductance. Capacitors may be placed directly under the device using a standard escape pattern. Others may surround the part.

These capacitors should have a value of 0.01 or 0.1 µF. Only ceramic SMT (surface mount technology) capacitors should be used to minimize lead inductance, preferably 0402 or 0603 sizes.

In addition, it is recommended that there be several bulk storage capacitors distributed around the PCB, feeding the V_{DD}, OV_{DD}, GV_{DD}, and LV_{DD} planes, to enable quick recharging of the smaller chip capacitors. These bulk capacitors should have a low ESR (equivalent series resistance) rating to ensure the quick response time necessary. They should also be connected to the power and ground planes through two vias to minimize inductance. Suggested bulk capacitors—100–330 µF (AVX TPS tantalum or Sanyo OSCON).

17.4 Connection Recommendations

To ensure reliable operation, it is highly recommended to connect unused inputs to an appropriate signal level. Unused active low inputs should be tied to OV_{DD}, GV_{DD}, or LV_{DD} as required. Unused active high inputs should be connected to GND. All NC (no-connect) signals must remain unconnected.

Power and ground connections must be made to all external V_{DD}, GV_{DD}, LV_{DD}, OV_{DD}, and GND pins of the MPC8540.

17.5 Output Buffer DC Impedance

The MPC8540 drivers are characterized over process, voltage, and temperature. There are two driver types: a push-pull single-ended driver (open drain for I^2C) for all buses except RapidIO, and a current-steering differential driver for the RapidIO port.

To measure Z_0 for the single-ended drivers, an external resistor is connected from the chip pad to OV_{DD} or GND. Then, the value of each resistor is varied until the pad voltage is $OV_{DD}/2$ (see Figure 53). The output impedance is the average of two components, the resistances of the pull-up and pull-down devices. When data is held high, SW1 is closed (SW2 is open) and R_P is trimmed until the voltage at the pad equals $OV_{DD}/2$. R_P then becomes the resistance of the pull-up devices. R_P and R_N are designed to be close to each other in value. Then, $Z_0 = (R_P + R_N)/2$.

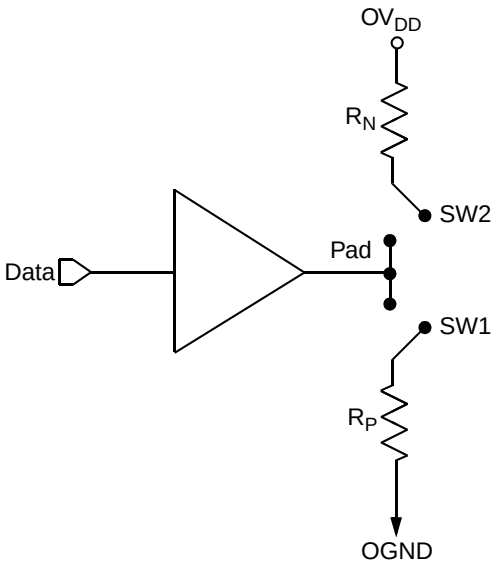

Figure 53. Driver Impedance Measurement

The output impedance of the RapidIO port drivers targets 200-Ω differential resistance. The value of this resistance and the strength of the driver's current source can be found by making two measurements. First, the output voltage is measured while driving logic 1 without an external differential termination resistor. The measured voltage is $V_1 = R_{source} \times I_{source}$. Second, the output voltage is measured while driving logic 1 with an external precision differential termination resistor of value R_{term}. The measured voltage is $V_2 = 1/(1/R_1 + 1/R_2)) \times I_{source}$. Solving for the output impedance gives $R_{source} = R_{term} \times (V_1/V_2 - 1)$. The drive current is then $I_{source} = V_1/R_{source}$.

Table 60 summarizes the signal impedance targets. The driver impedance are targeted at minimum V_{DD}, nominal OV_{DD}, 105°C.

Table 60. Impedance Characteristics

Impedance	Local Bus, Ethernet, DUART, Control, Configuration, Power Management	PCI/PCI-X	DDR DRAM	RapidIO	Symbol	Unit
R_N	43 Target	25 Target	20 Target	NA	Z_0	W
R_P	43 Target	25 Target	20 Target	NA	Z_0	W
Differential	NA	NA	NA	200 Target	Z_{DIFF}	W

Note: Nominal supply voltages. See Table 1, T_j = 105°C.

17.6 Configuration Pin Muxing

The MPC8540 provides the user with power-on configuration options which can be set through the use of external pull-up or pull-down resistors of 4.7 kΩ on certain output pins (see customer visible configuration pins). These pins are generally used as output only pins in normal operation.

While HRESET is asserted however, these pins are treated as inputs. The value presented on these pins while HRESET is asserted, is latched when HRESET deasserts, at which time the input receiver is disabled and the I/O circuit takes on its normal function. Most of these sampled configuration pins are equipped with an on-chip gated resistor of approximately 20 kΩ. This value should permit the 4.7-kΩ resistor to pull the configuration pin to a valid logic low level. The pull-up resistor is enabled only during HRESET (and for platform/system clocks after HRESET deassertion to ensure capture of the reset value). When the input receiver is disabled the pull-up is also, thus allowing functional operation of the pin as an output with minimal signal quality or delay disruption. The default value for all configuration bits treated this way has been encoded such that a high voltage level puts the device into the default state and external resistors are needed only when non-default settings are required by the user.

Careful board layout with stubless connections to these pull-down resistors coupled with the large value of the pull-down resistor should minimize the disruption of signal quality or speed for output pins thus configured.

The platform PLL ratio and e500 PLL ratio configuration pins are not equipped with these default pull-up devices.

17.7 Pull-Up Resistor Requirements

The MPC8540 requires high resistance pull-up resistors (10 kΩ is recommended) on open drain type pins including EPIC interrupt pins. I^2C open drain type pins should be pulled up with ~1 kΩ resistors.

Correct operation of the JTAG interface requires configuration of a group of system control pins as demonstrated in Figure 55. Care must be taken to ensure that these pins are maintained at a valid deasserted state under normal operating conditions as most have asynchronous behavior and spurious assertion will give unpredictable results.

TSEC1_TXD[3:0] must not be pulled low during reset. Some PHY chips have internal pulldowns that could cause this to happen. If such PHY chips are used, then a pullup must be placed on these signals strong enough to restore these signals to a logical 1 during reset.

Three test pins also require pull-up resistors (100 Ω - 1 kΩ). These pins are L1_TSTCLK, L2_TSTCLK, and LSSD_MODE. These signals are for factory use only and must be pulled up to OVDD for normal machine operation.

Refer to the PCI 2.2 specification for all pull-ups required for PCI.

17.8 JTAG Configuration Signals

Boundary-scan testing is enabled through the JTAG interface signals. The $\overline{\text{TRST}}$ signal is optional in the IEEE Std 1149.1 specification, but is provided on all processors that implement the Power Architecture. The device requires $\overline{\text{TRST}}$ to be asserted during reset conditions to ensure the JTAG boundary logic does not interfere with normal chip operation. While it is possible to force the TAP controller to the reset state using only the TCK and TMS signals, generally systems will assert $\overline{\text{TRST}}$ during the power-on reset flow. Simply tying $\overline{\text{TRST}}$ to $\overline{\text{HRESET}}$ is not practical because the JTAG interface is also used for accessing the common on-chip processor (COP) function.

The COP function of these processors allow a remote computer system (typically, a PC with dedicated hardware and debugging software) to access and control the internal operations of the processor. The COP interface connects primarily through the JTAG port of the processor, with some additional status monitoring signals. The COP port requires the ability to independently assert $\overline{\text{HRESET}}$ or $\overline{\text{TRST}}$ in order to fully control the processor. If the target system has independent reset sources, such as voltage monitors, watchdog timers, power supply failures, or push-button switches, then the COP reset signals must be merged into these signals with logic.

The arrangement shown in Figure 54 allows the COP port to independently assert $\overline{\text{HRESET}}$ or $\overline{\text{TRST}}$, while ensuring that the target can drive $\overline{\text{HRESET}}$ as well.

The COP interface has a standard header, shown in Figure 54, for connection to the target system, and is based on the 0.025" square-post, 0.100" centered header assembly (often called a Berg header). The connector typically has pin 14 removed as a connector key.

The COP header adds many benefits such as breakpoints, watchpoints, register and memory examination/modification, and other standard debugger features. An inexpensive option can be to leave the COP header unpopulated until needed.

There is no standardized way to number the COP header; consequently, many different pin numbers have been observed from emulator vendors. Some are numbered top-to-bottom then left-to-right, while others use left-to-right then top-to-bottom, while still others number the pins counter clockwise from pin 1 (as with an IC). Regardless of the numbering, the signal placement recommended in Figure 54 is common to all known emulators.

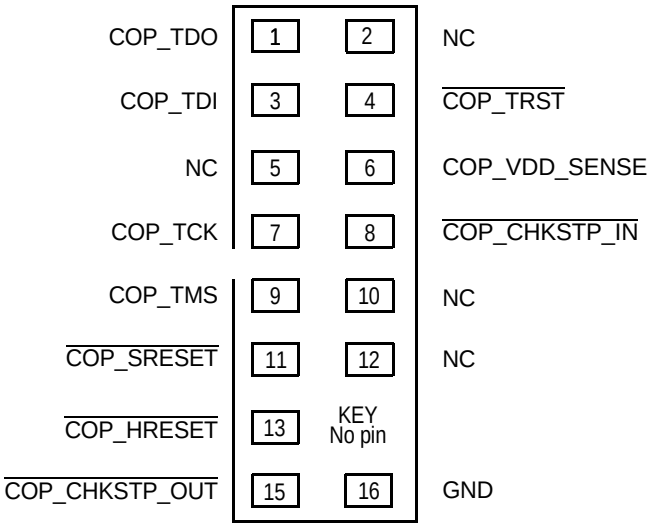

Figure 54. COP Connector Physical Pinout

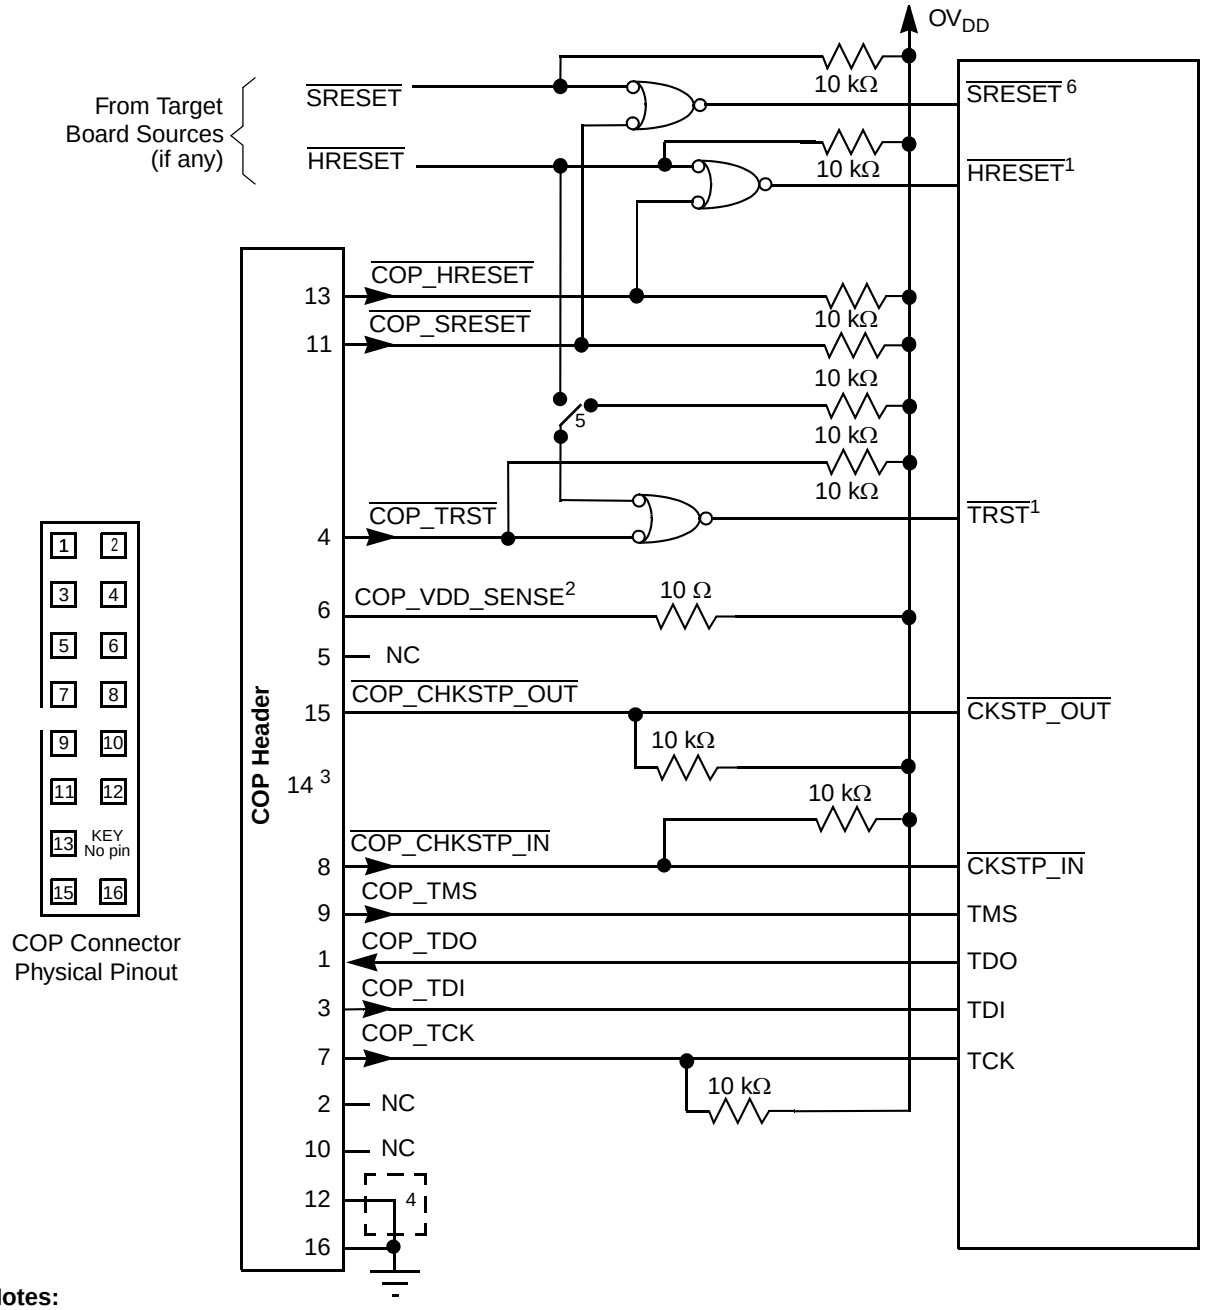
17.8.1 Termination of Unused Signals

If the JTAG interface and COP header will not be used, Freescale recommends the following connections:

- $\overline{\text{TRST}}$ should be tied to $\overline{\text{HRESET}}$ through a 0 kΩ isolation resistor so that it is asserted when the system reset signal ($\overline{\text{HRESET}}$) is asserted, ensuring that the JTAG scan chain is initialized during the power-on reset flow. Freescale recommends that the COP header be designed into the system as shown in Figure 55. If this is not possible, the isolation resistor will allow future access to $\overline{\text{TRST}}$ in case a JTAG interface may need to be wired onto the system in future debug situations.
- Tie TCK to OV_{DD} through a 10 kΩ resistor. This will prevent TCK from changing state and reading incorrect data into the device.
- No connection is required for TDI, TMS, or TDO.



Notes:

1. The COP port and target board should be able to independently assert $\overline{\text{HRESET}}$ and $\overline{\text{TRST}}$ to the processor in order to fully control the processor as shown here.
2. Populate this with a 10 Ω resistor for short-circuit/current-limiting protection.
3. The KEY location (pin 14) is not physically present on the COP header.
4. Although pin 12 is defined as a No-Connect, some debug tools may use pin 12 as an additional GND pin for improved signal integrity.
5. This switch is included as a precaution for BSDL testing. The switch should be open during BSDL testing to avoid accidentally asserting the $\overline{\text{TRST}}$ line. If BSDL testing is not being performed, this switch should be closed or removed.
6. Asserting $\overline{\text{SRESET}}$ causes a machine check interrupt to the e500 core.

Figure 55. JTAG Interface Connection

18 Document Revision History

Table 61 provides a revision history for this hardware specification.

Table 61. Document Revision History

Rev. No.	Substantive Change(s)
4.1	Inserted Figure 3 and paragraph above it. Added PCI/PCI-X row to Input Voltage characteristic and added footnote 6 to Table 1.
4	Updated Note in Section 2.1.2, “Power Sequencing.” Updated back page information.
3.5	Updated Section 2.1.2, “Power Sequencing.” Replaced Section 17.8, “JTAG Configuration Signals.”
3.4	Corrected MV_{REF} Max Value in Table 1. Corrected MV_{REF} Max Value in Table 2. Added new revision level information to Table 62
3.3	Updated MV_{REF} Max Value in Table 1. Removed Figure 3. In Table 4, replaced TBD with power numbers and added footnote. Updated specs and footnotes in Table 8. Corrected max number for MV_{REF} in Table 13. Changed parameter “Clock cycle duration” to “Clock period” in Table 29. Added note 4 to $t_{LBKHOV1}$ and removed LALE reference from $t_{LBKHOV3}$ in Table 36 and Table 37. Updated LALE signal in Figure 19 and Figure 20. Modified Figure 23. Modified Figure 55.

Table 61. Document Revision History (continued)

Rev. No.	Substantive Change(s)
3.2	Updated Table 1 and Table 2 with 1.0 GHz device parameter requirements. Added Section 2.1.2, “Power Sequencing”. Updated Table 4 with Maximum power data. Updated Table 4 and Table 5 with 1 GHz speed grade information. Updated Table 6 with corrected typical I/O power numbers. Updated Table 7 Note 2 lower voltage measurement point. Replaced Table 7 Note 5 with spread spectrum clocking guidelines. Added to Table 8 rise and fall time information. Added Section 4.4, “Real Time Clock Timing”. Added precharge information to Section 6.2.2, “DDR SDRAM Output AC Timing Specifications”. Updated Table 20 minimum and maximum baud rates. Removed V_{IL} and V_{IH} references from Table 23, Table 24, Table 25, and Table 26. Added reference level note to Table 23, Table 24, Table 25, Table 26, Table 27, Table 28, and Table 29. Updated TXD references to TCG in Section 8.2.3.1, “TBI Transmit AC Timing Specifications”. Updated PMA_RX_CLK references to RX_CLK in Section 8.2.3.2, “TBI Receive AC Timing Specifications”. Updated t_{TTKHDX} value in Table 27. Updated RXD references to RCG in Section 8.2.3.2, “TBI Receive AC Timing Specifications”. Updated Table 29 Note 2. Removed V_{IL} and V_{IH} references from Table 31, and Table 32. Added reference level note to Table 31, and Table 32. Corrected Figure 15 and Figure 16. Corrected Table 34 f_{MDC} and t_{MDC} to reflect the correct minimum operating frequency. Updated Table 34 t_{MDKHDV} and t_{MDKHDX} values for clarification. Added t_{LBKHKT} and updated Note 2 in Table 37. Corrected $\overline{\text{LGTA}}$ timing references in Figure 19. Updated Figure 20, Figure 22, and Figure 24. Updated Figure 44. Clarified Table 53 Note 5. Updated Table 54 and Table 55 with 1 GHz information. Added heat sink removal discussion to Section 16.2.3, “Thermal Interface Materials”. Corrected and added 1 GHz part number to Table 62.
3.1	Updated Table 4 and Table 5. Added Table 6. Added MCK duty cycle to Table 16. Updated f_{MDC}, t_{MDC}, t_{MDKHDV}, and t_{MDKHDX} parameters in Table 34. Added LALE to $t_{LBKHOV3}$ parameter in Table 36 and Table 37, and updated Figure 19 and Figure 20. Corrected active level designations of some of the pins in Table 53. Updated Table 62.

Table 61. Document Revision History (continued)

Rev. No.	Substantive Change(s)
3.0	Table 1—Corrected MII management voltage reference Section 2.1.3—New Table 2—Corrected MII management voltage reference Table 4—Added V_{DD} power table Table 5—Added AV_{DD} power table Table 7—New Table 8—New Table 9—New Table 13—Added overshoot/undershoot note. Figure 4—New Table 16—Restated $t_{MCKSKEW1}$ as $t_{MCKSKEW}$, removed $t_{MCKSKEW2}$; added speed-specific minimum values for 333, 266, and 200 MHz; updated t_{DDSHME} values. Updated chapter to reflect that GMII, MII and TBI can be run with 2.5V signalling. Table 34—Added MDIO output valid timing Table 36—Updated $t_{LBIVKH1}$, $t_{LBIXKH1}$, and t_{LBOTOT}. Table 37—New Table 20, Table 22, Table 24—Updated clock reference Table 44—Updated t_{PCIVKH} Section 14.1— Changed minimum height from 2.22 to 3.07 and maximum from 2.76 to 3.75 Table 53.—Updated MII management voltage reference and added note 20. Section 16.2.4.1—Changed θ_{JC} from 0.3 to 0.8; changed die-junction temperature from 67 to 71 Section 17.7—Added paragraph that begins “TSEC1_TXD[3:0]...”

Table 61. Document Revision History (continued)

Rev. No.	Substantive Change(s)

Table 61. Document Revision History (continued)

Rev. No.	Substantive Change(s)
1.2	Section 1.1.1—Updated feature list. Section 1.2.1.1—Updated notes for Table 1. Section 1.2.1.2—Removed 5-V PCI interface overshoot and undershoot figure. Section 1.2.1.3—Added this section to summarize impedance driver settings for various interfaces. Section 1.4—Updated rows in Reset Initialization timing specifications table. Added a table with DLL and PLL timing specifications. Section 1.5.2.2—Updated note 6 of DDR SDRAM Output AC Timing Specifications table. Section 1.7—Changed the minimum input low current from -600 to -15 μA for the RGMII DC electrical characteristics. Section 1.8.2—Changed LCS[3:4] to TSEC1_TXD[6:5] in. Updated notes regarding LCS[3:4]. Section 1.13.2—Updated the mechanical dimensions diagram for the package. Section 1.13.3—Updated the notes for LBCTL, TRIG_OUT, and ASLEEP. Corrected pin assignments for IIC_SDA and IIC_SCL. Corrected reserved pin assignment of V11 to U11. V11 is actually $\overline{\text{PCI\_STOP}}$. Section 1.14.1—Updated the table for frequency options with respect to platform/CCB frequencies. Section 1.14.4—Edited Frequency options with respect to memory bus speeds.
1.1	Section 1.6.1—Added symbols and note for the GTX_CLK125 timing parameters. Section 1.11.3—Updated pin list table: LGPL5/LSDAMUX to LGPL5, LA[27:29] and LA[30:31] to LA[27:31], FEC_TXD[0:3] to FEC_TXD[3:0], FEC_RXD[0:3] to FEC_RXD[3:0], TRST to $\overline{\text{TRST}}$, added GBE Clocking section and EC_GTX_CLK125 signal. Updated thermal model information to match current offering.
1	Original Customer Version.

19 Device Nomenclature

Ordering information for the parts fully covered by this specification document is provided in Section 19.1, "Nomenclature of Parts Fully Addressed by this Document."

19.1 Nomenclature of Parts Fully Addressed by this Document

Table 62 provides the Freescale part numbering nomenclature for the MPC8540. Note that the individual part numbers correspond to a maximum processor core frequency. For available frequencies, contact your local Freescale sales office. In addition to the processor frequency, the part numbering scheme also includes an application modifier which may specify special application conditions. Each part number also contains a revision code which refers to the die mask revision number.

Table 62. Part Numbering Nomenclature

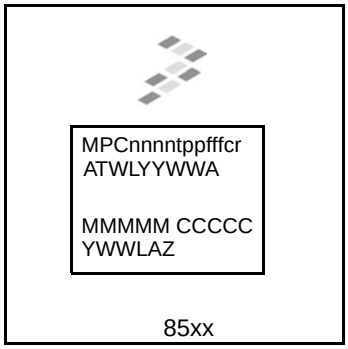
MPC	nnnn	*t*	pp	ff(f)	c	r
Product Code	**Part Identifier**	**Temperature Range[1]**	**Package [2]**	**Processor Frequency [3, 4]**	**Platform Frequency**	**Revision Level**
MPC	8540	Blank = 0 to 105°C C = –40 to 105°C	PX = FC-PBGA VT = FC-PBGA (Pb-free)	833 = 833 MHz 667 = 667 MHz	L = 333 MHz J = 266 MHz	B = Rev. 2.0 (SVR = 0x80300020) C = Rev. 2.1 (SVR = 0x80300021)
MPC	8540	Blank = 0 to 105°C C = –40 to 105°C	PX = FC-PBGA VT = FC-PBGA (Pb-free)	AQ = 1.0 GHz	F = 333 MHz	B = Rev. 2.0 (SVR = 0x80300020) C = Rev. 2.1 (SVR = 0x80300021)

Notes:

1. For Temperature Range=C, Processor Frequency is limited to 667 MHz.
2. See Section 14, "Package and Pin Listings," for more information on available package types.
3. Processor core frequencies supported by parts addressed by this specification only. Not all parts described in this specification support all core frequencies. The core must be clocked at a minimum frequency of 400MHz. A device must not be used beyond the core frequency or platform frequency indicated on the device.
4. Designers should use the maximum power value corresponding to the core and platform frequency grades indicated on the device. A lower maximum power value should not be assumed for design purposes even when running at a lower frequency.

19.2 Part Marking

Parts are marked as the example shown in Figure 56.



FC-PBGA

Notes:

MMMMM is the 5-digit mask number.
ATWLYYWWA is the traceability code.
CCCCC is the country of assembly. This space is left blank if parts are assembled in the United States.
YWWLAZ is the assembly traceability code.
